

# Why do we age? The role of biology

Alfred Fisher M.D., Ph.D.

Associate Professor and Chief

Division of Geriatrics, Gerontology, and Palliative Medicine

Department Of Internal Medicine

University of Nebraska Medical Center

# What is Aging?

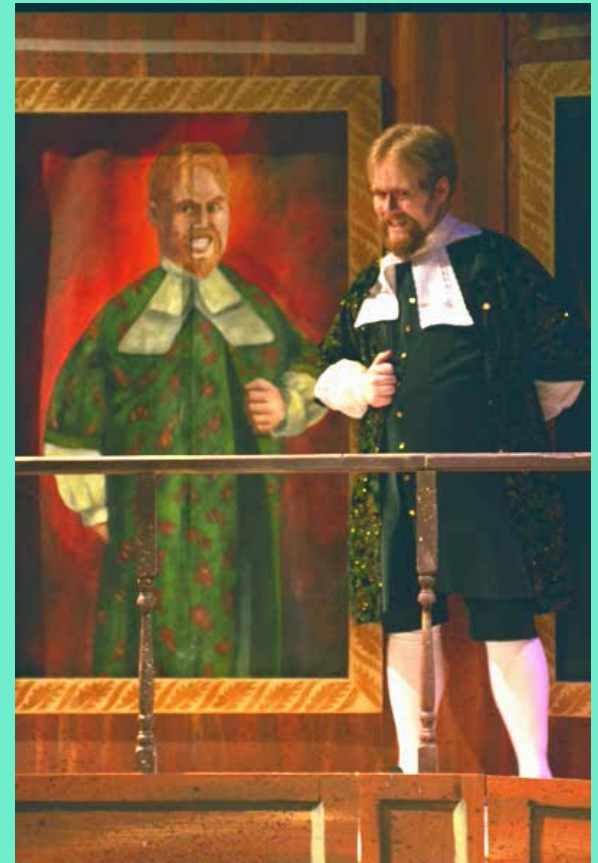

A natural, non-pathologic process affecting all organisms which leads to:

- Characteristic Phenotypic Features
- Loss of Reproductive Capability
- Decreased Physiologic Reserves
- Increased Susceptibility to Disease

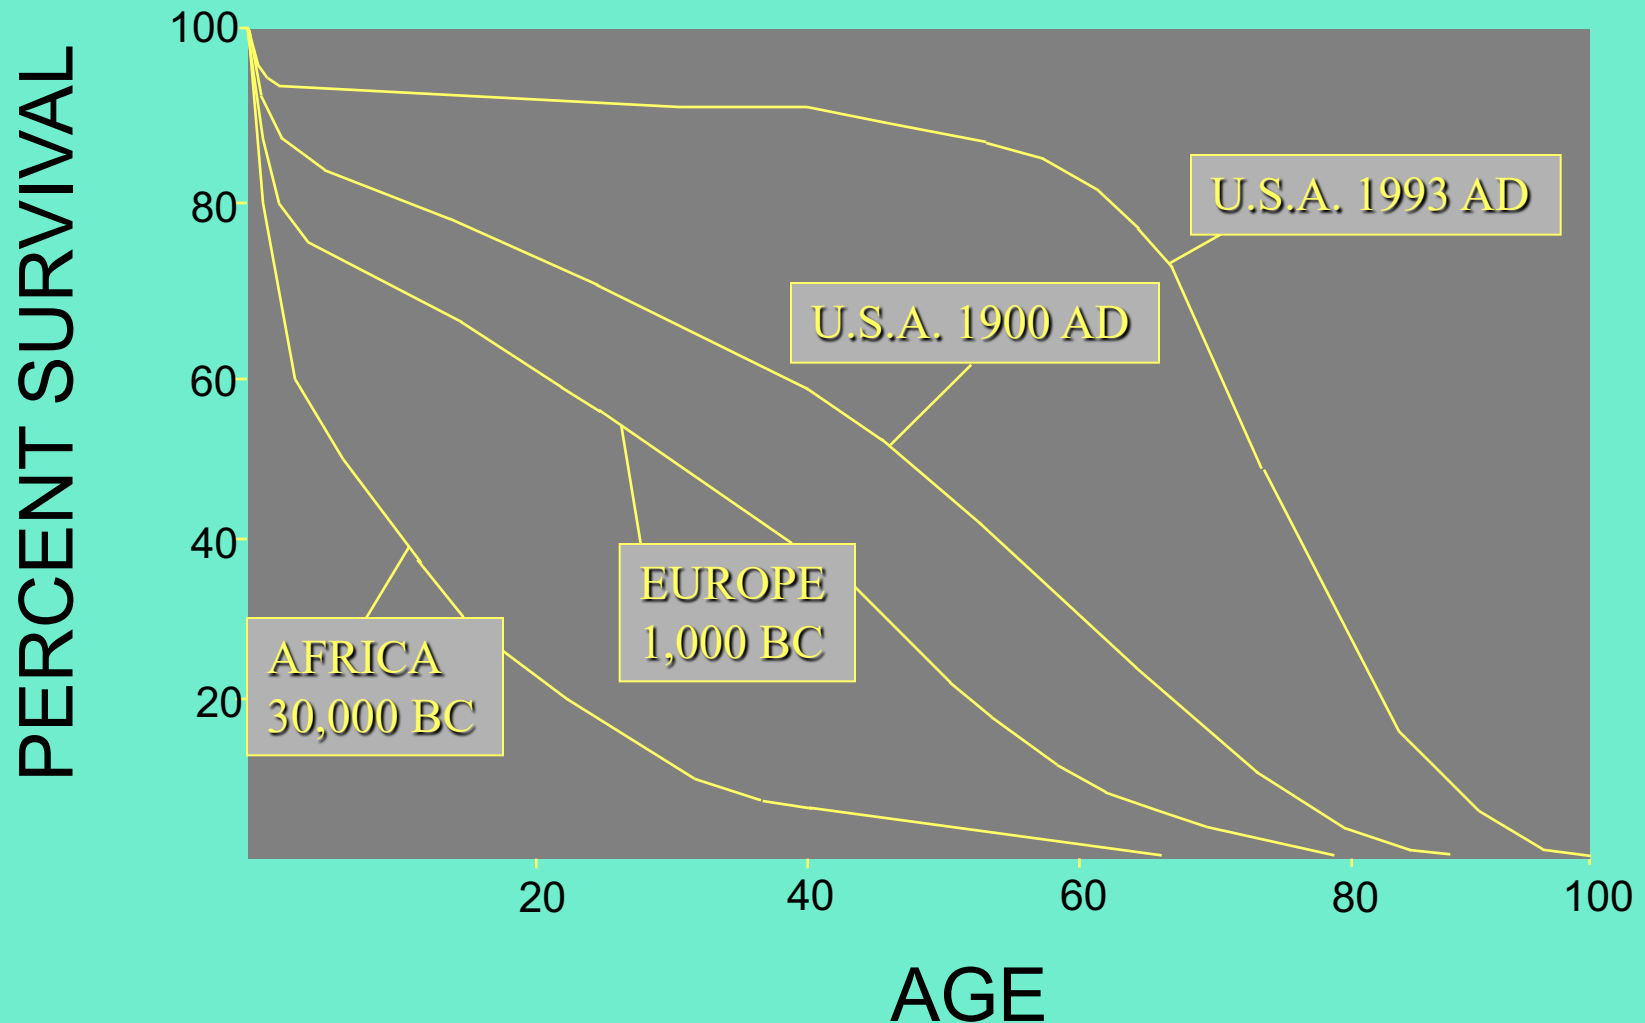

# Why is Aging of Interest?

- Age is a major risk factor for virtual all adult illnesses
- Age is a major risk factor for disability and dependence
- Aging is the only health-related Condition that affects each and every person
- Aging has been of keen interest to humans throughout time

# Is Human Lifespan and Aging Immutable?

# But has this altered aging?

- Environment influences mean lifespan
  - Nutrition, safer environment, clean water, sanitation
- In contrast, maximal longevity is genetically determined
  - Naked mole rat vs rat
- Hence both mean and maximal lifespan can be altered

Lifespan ~800 days

Lifespan up to 30 years

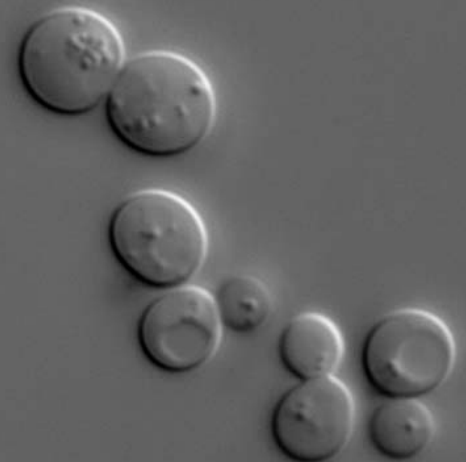

# How do you Study Aging Biology?

Quite a Challenge:

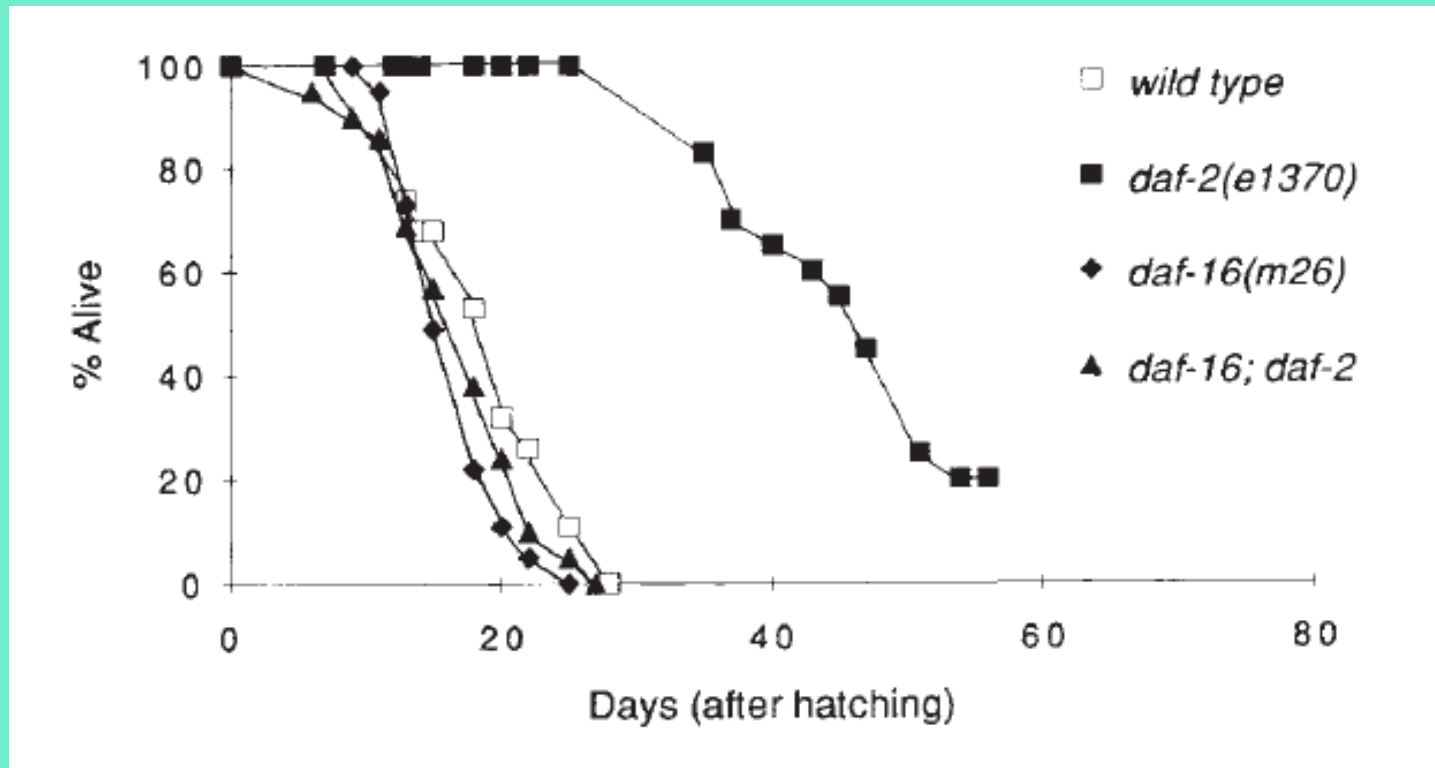

- Animals of interest have long lifespans
- Difficulty of separating causes from effects
- Global effects of aging
- Lack of model organisms
- Lack of interventions with known effects

# Remarkably Model Systems were Developed

- Simple Manipulations can Alter Aging
  - Caloric Restriction
  - Delayed Reproduction
- Genes were Identified in Many Species
  - Yeast
  - *C. elegans*
  - *Drosophila*
  - Mice
  - Humans

# Insights from Lower Animals

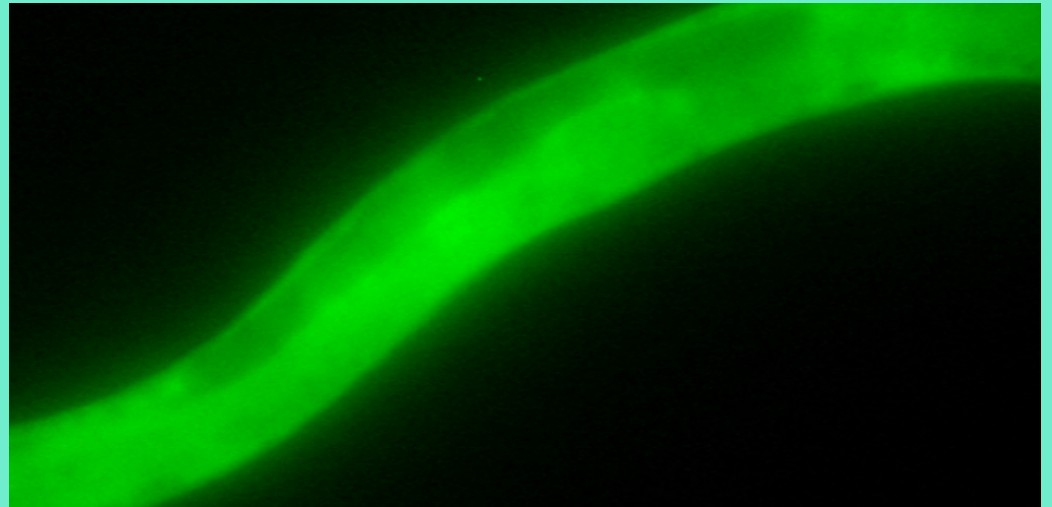

# What does *daf-2* do?

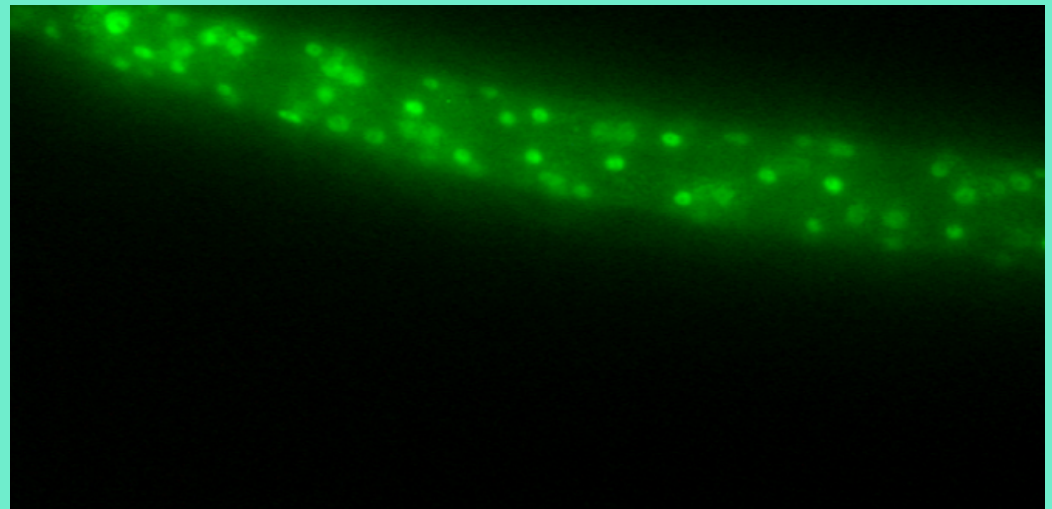

DAF-16

GFP

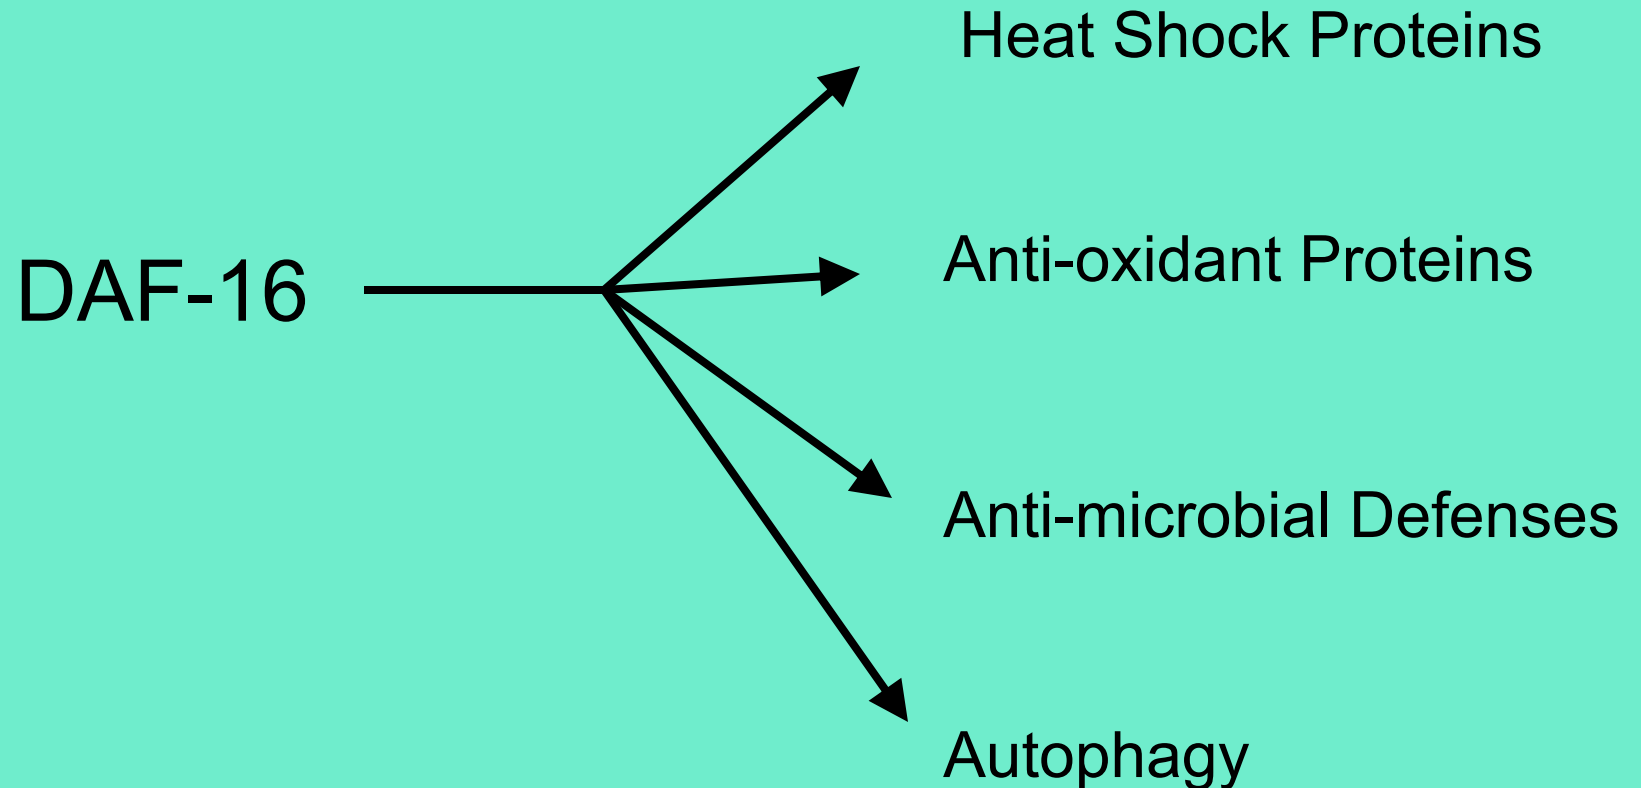

DAF-2 On

DAF-2 Off

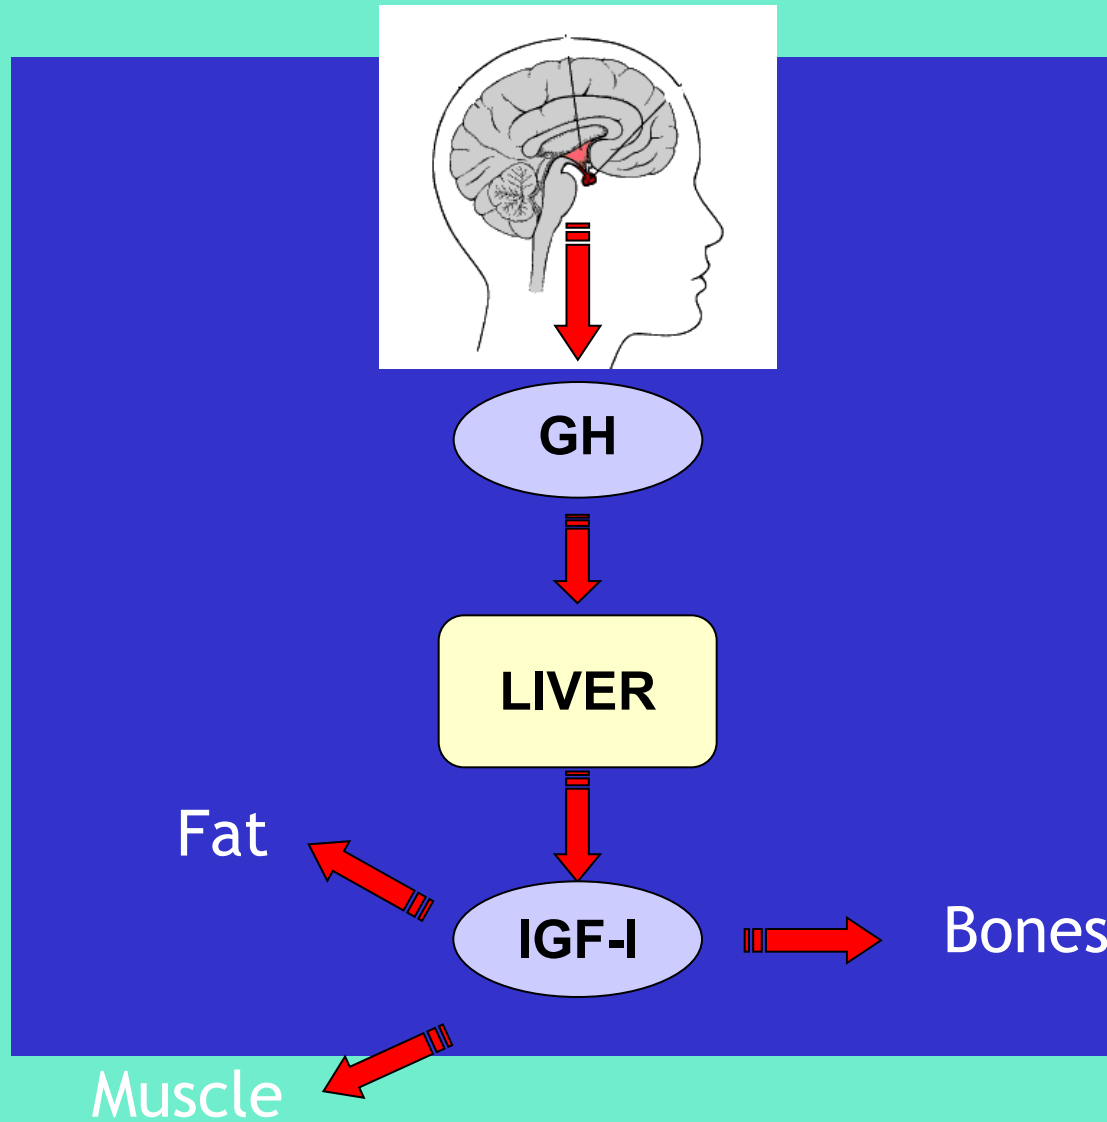

# What does *daf-2* do?

# What are *daf-2* and *daf-16*?

- *daf-2* is analogous to the insulin and IGF-1 receptors in people
- *daf-16* is analogous to the FOXO3 transcription factor in people
- These genes work together in insulin signaling in the liver

# Growth Hormone – IGF-1 Axis

# GH/IGF-1 in Mice

Ames and Snell Dwarf Mice  
lack GH and are Long-lived.

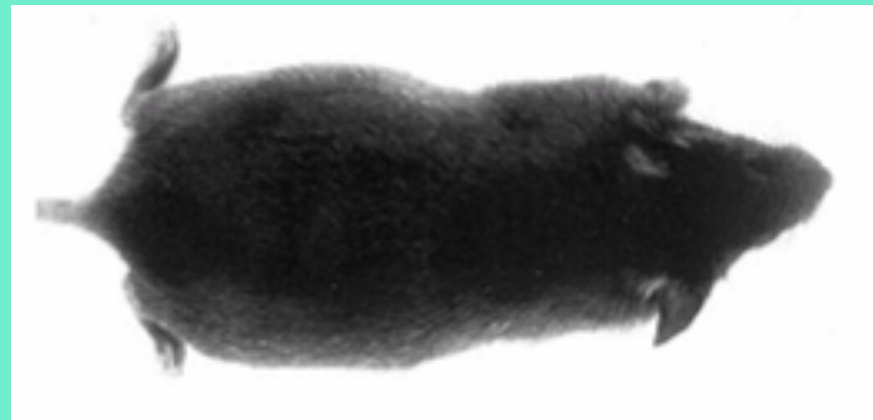

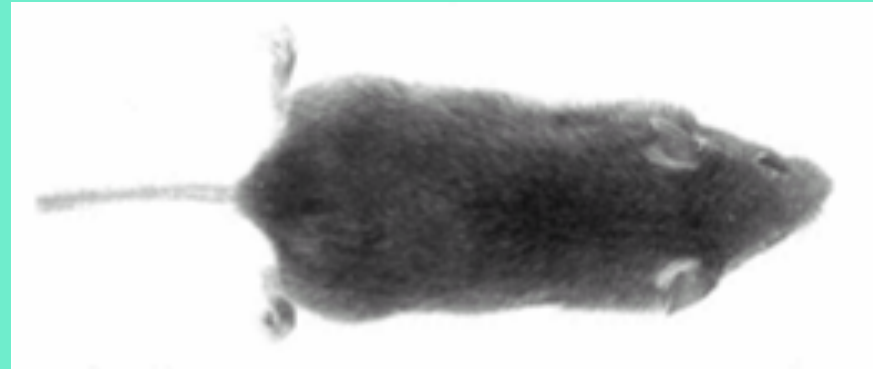

Laron Dwarf Mice lack the  
GH receptor and are Long-lived.

Mice with mutations in the  
IGF-1 receptor are Long-lived.

Giving Mice GH results  
in Big Mice and Accelerated  
Aging

GH →

IGF-1 →

# Body size and lifespan in humans

**77 years**

5ft 8in

**75.5 years**

5ft 9.5in

**72.5 years**

5ft 10in

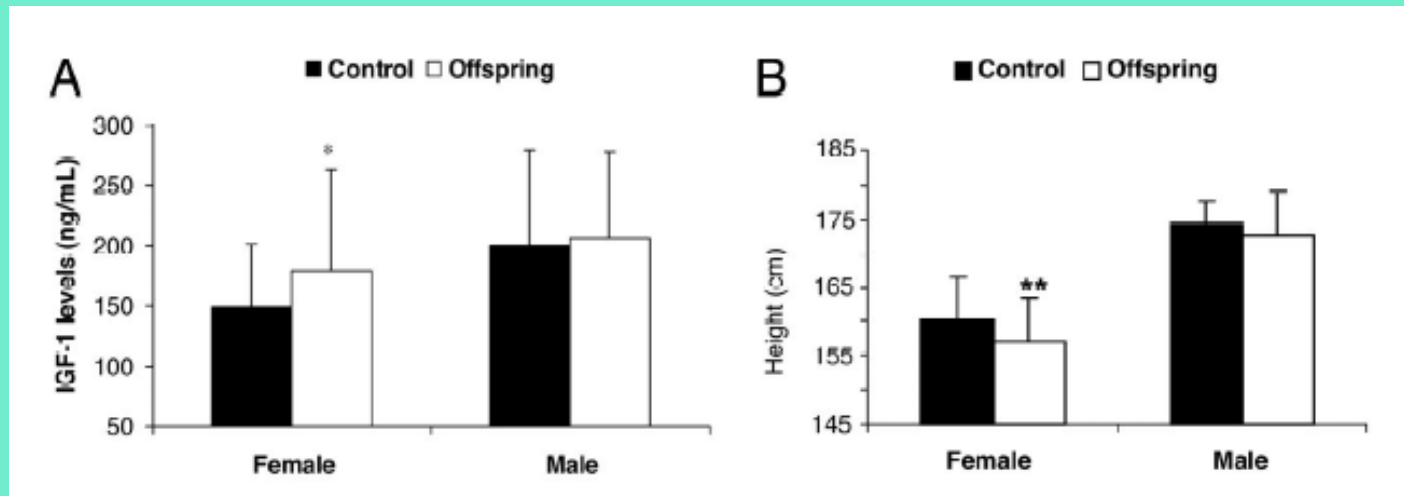

**70 years**

6ft 1in

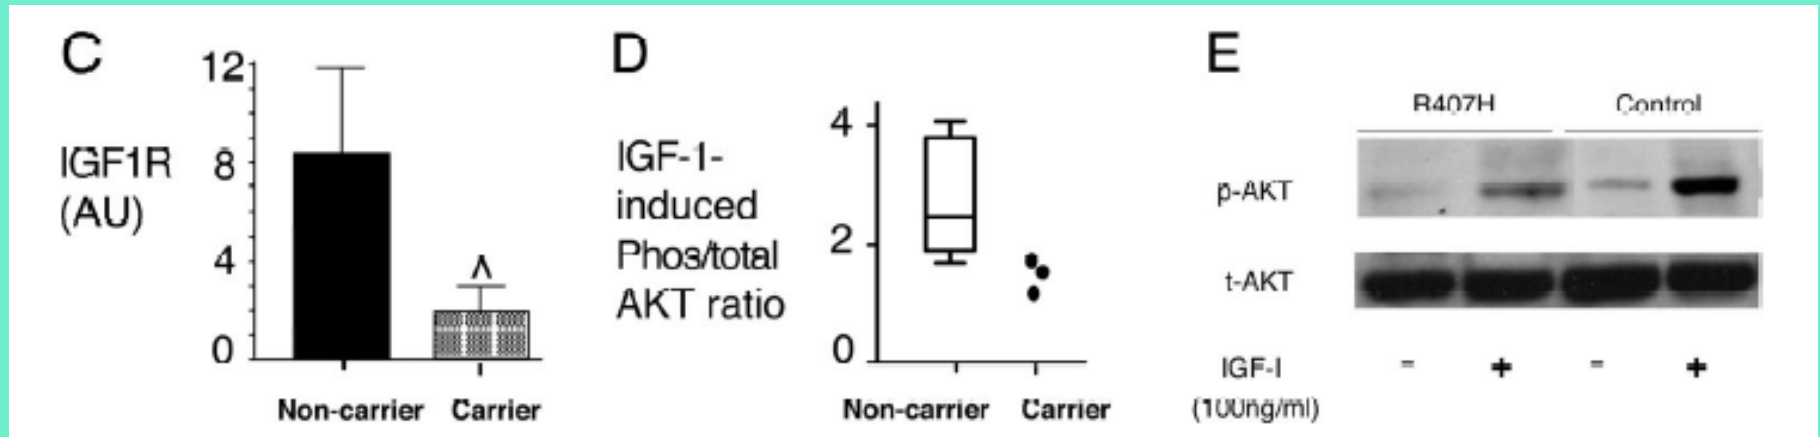

# Studies of IGF-1 signaling in the Centenarian cohort

- Female Offspring of centenarians have higher IGF-1 levels but are shorter than control from non-centenarian families
- Is IGF-1 signaling impaired?

- 9/384 centenarians (2.3%) but only 1/312 controls (0.3%) had a non-synonymous mutation

# Lymphocytes from Carriers have Less IGF-1R and Less Receptor Signaling

- These centenarians are resistant to IGF-1 effects and hence resemble the *daf-2* mutants

# Is All of Aging Controlled by IGF-1?

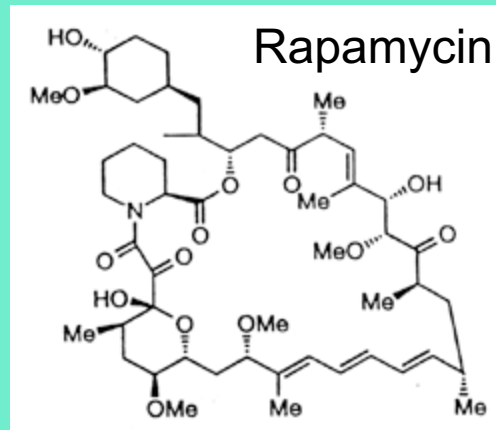

- Over 100 genes have effects on lifespan in model animals
- These have lead to the identification of aging pathways:
  - mTOR signaling
  - Autophagy
  - Sirtuins
  - Mitochondrial signaling
  - Cell senescence

# Can We Find Drugs that Could Extend Lifespan or Healthspan?

- Multiple drugs can increase lifespan in lower animals
  - Resveratrol
  - Rapamycin
  - Acarbose
  - ACE inhibitors
  - Metformin
  - Weak pro-oxidants
  - Some anti-seizure medications
- Could these play a role to:
  - Address role of aging in CV disease, DM, etc.
  - Prevent age-related diseases (AD or PD)
  - Modify Geriatric syndromes

# What is Rapamycin?

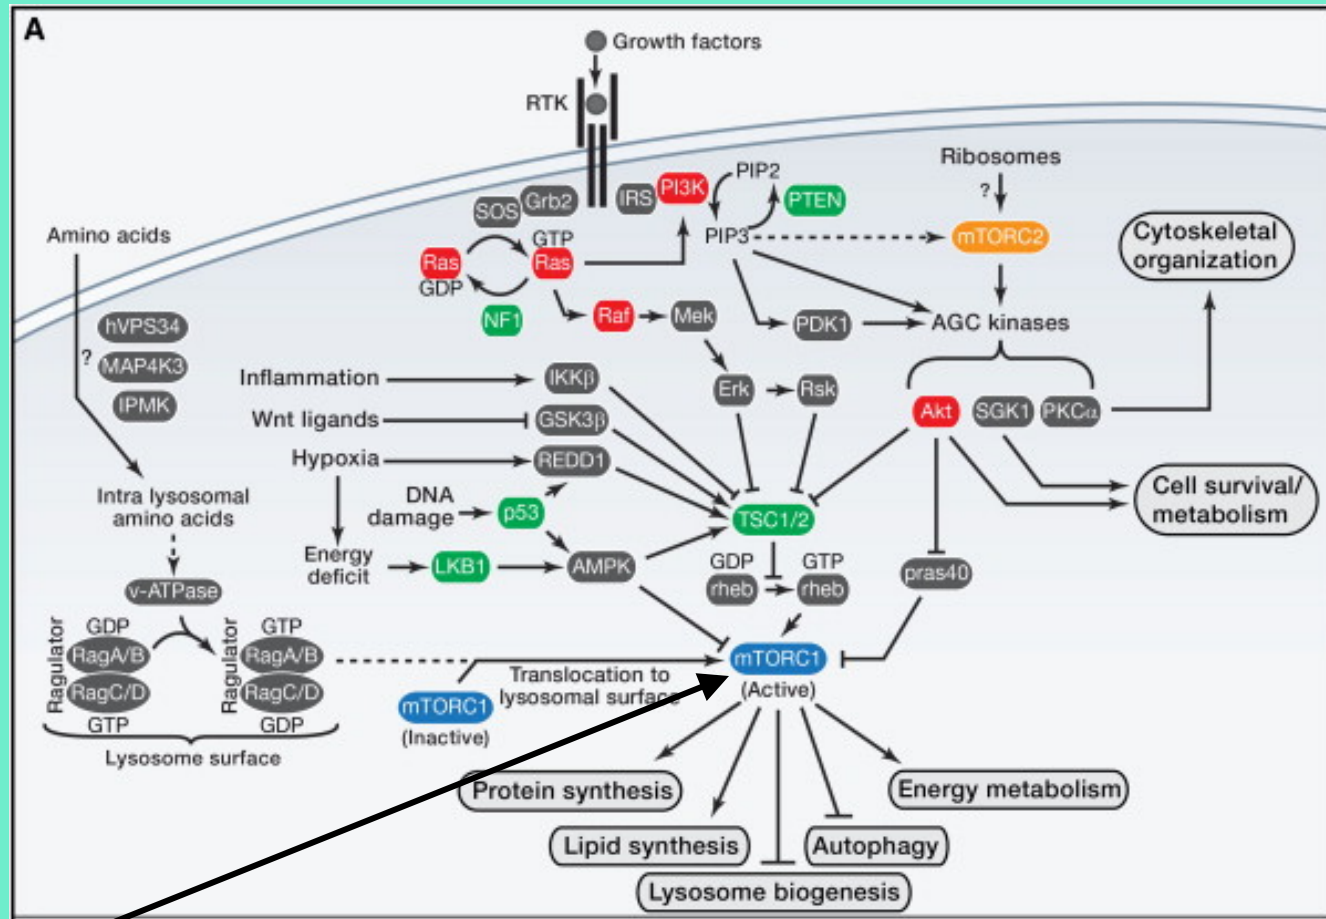

- Macrolide molecule made by *Streptomyces hygroscopicus*
- Discovered in 1970 by Brazilian scientists from soil from Easter Island
- Easter Island is called Rapa Nui by natives

# How did Rapamycin become a Drug?

- Developed in 1972 as an antifungal drug by Ayerst
- Found to suppress immunity in animals (died as antifungal)
- Found by NCI to be first cytostatic chemotherapeutic with wide spectrum of activity in mid-1970's (becomes high priority preclinical chemotherapeutic)
- In 1982, Wyeth closes Ayerst division in Canada (died as chemotherapeutic)
- In 1986, Wyeth changes CEO's. Rapamycin tested in animals as an immunosuppressant (becomes high priority drug for transplants)
- Use of Rapamycin in organ transplant published in Lancet in 1989. FDA approved for renal transplantation and drug-eluting stents

# What Does Rapamycin Do?

Inhibits the activity of TOR

Laplane, 2012

# This then leads to:

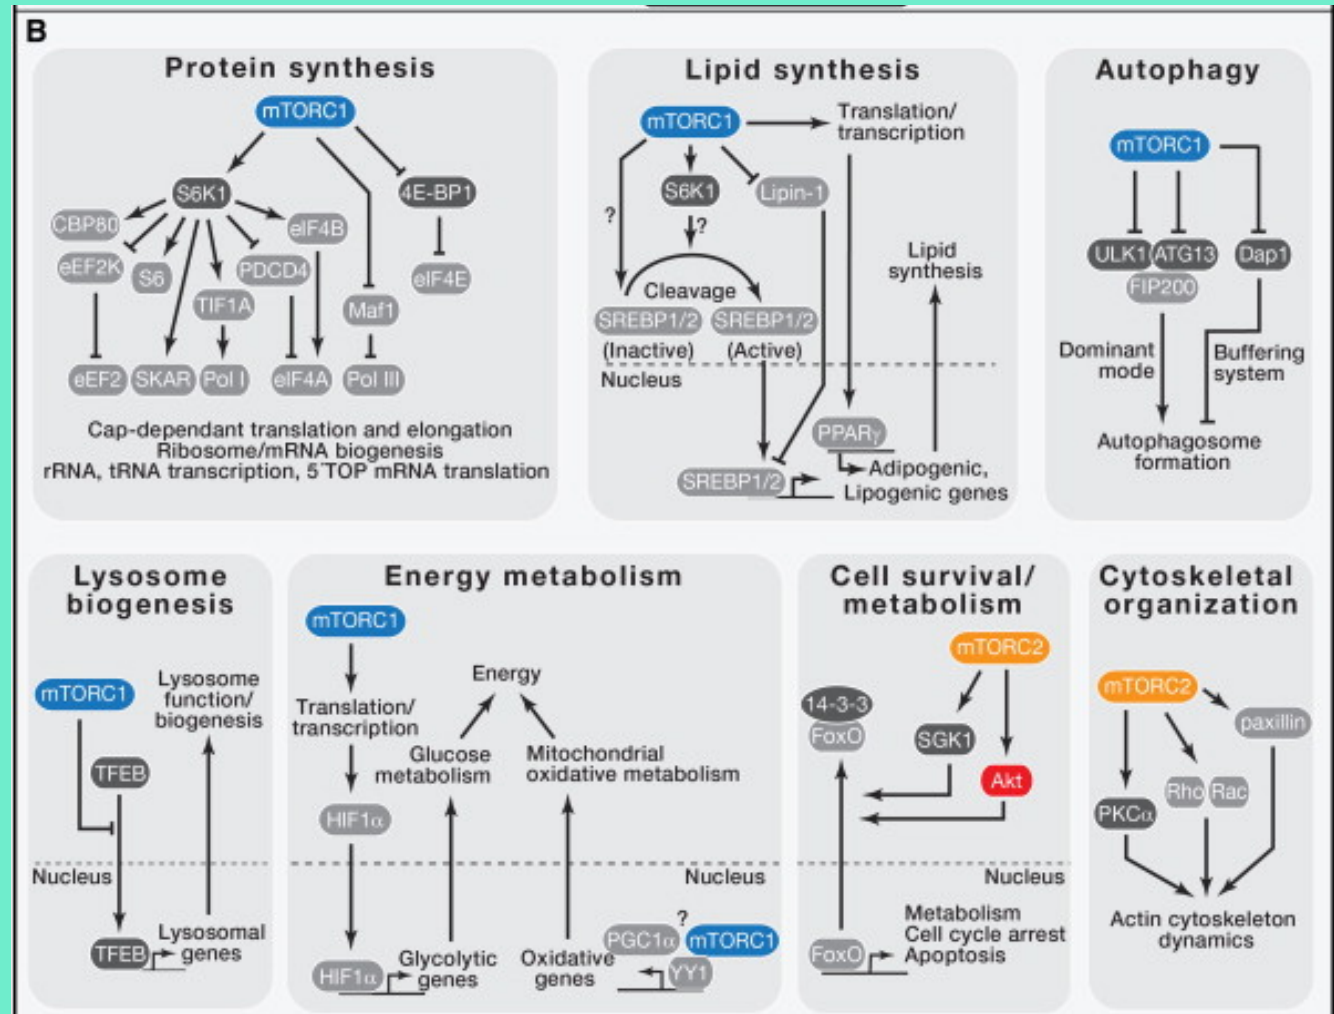

- Decreased protein synthesis

- Decreased lipid synthesis

- Increased lysosome and autophagosome production

- Reduced energy use

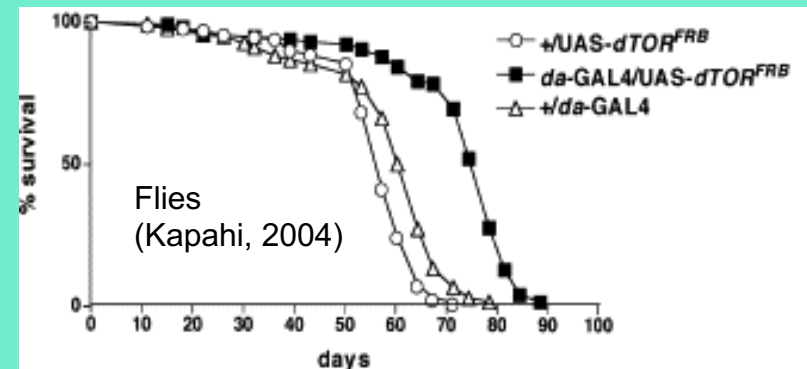

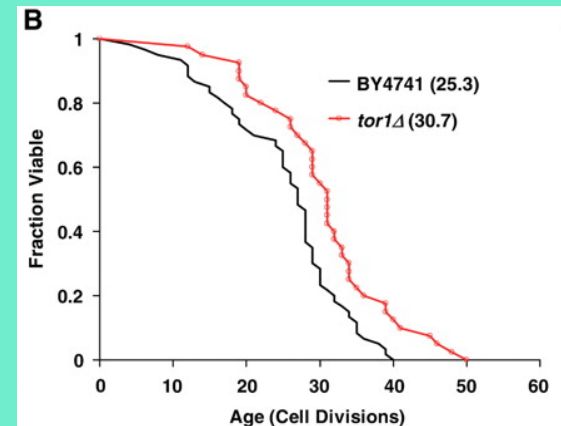

- And likely many other effects!

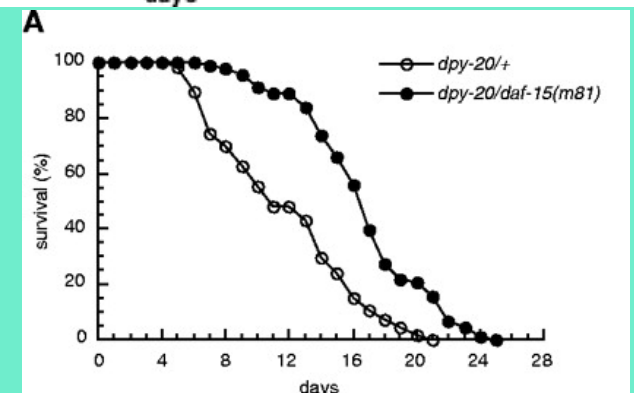

# Why Was Rapamycin Studied in Aging?

- TOR signaling is conserved from fungi to vertebrates
- Reducing TOR signaling increases lifespan in multiple species
- Caloric Restriction and Dwarf Mice have reduced TOR signaling

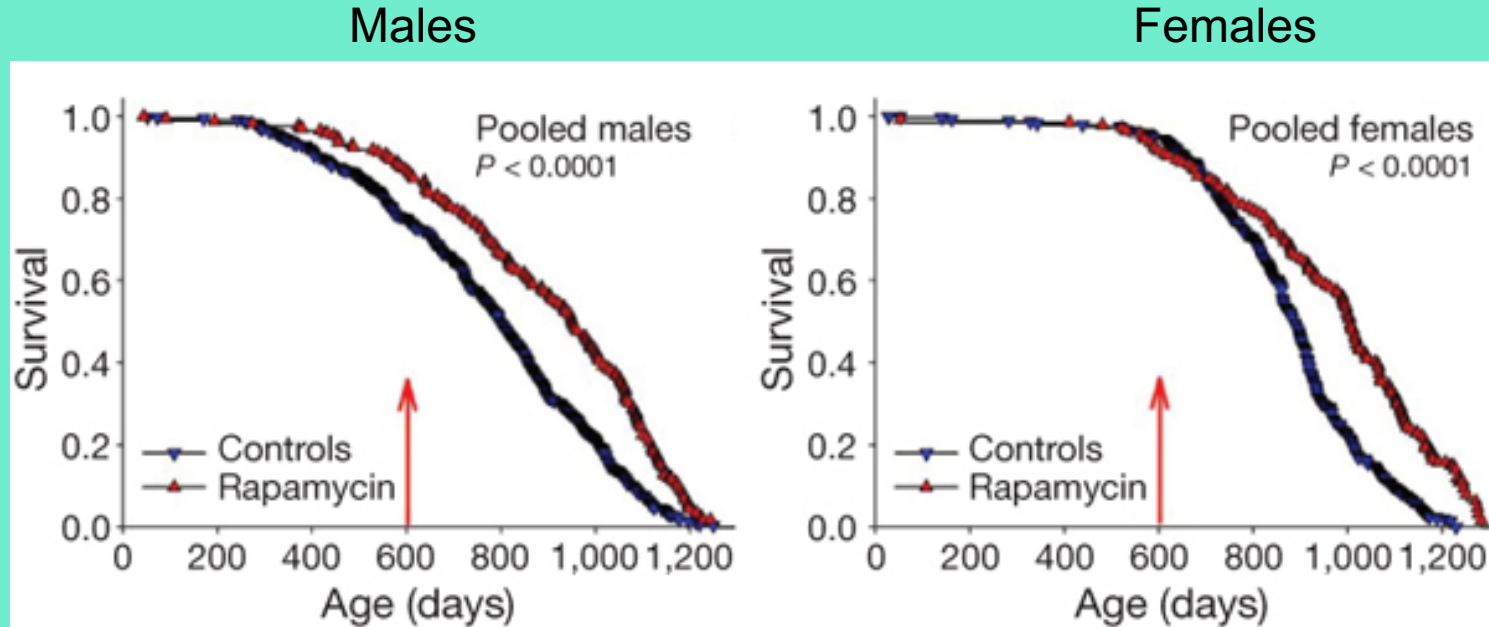

Yeast  
(Kaeberlein, 2005)

Worms  
(Jia, 2004)

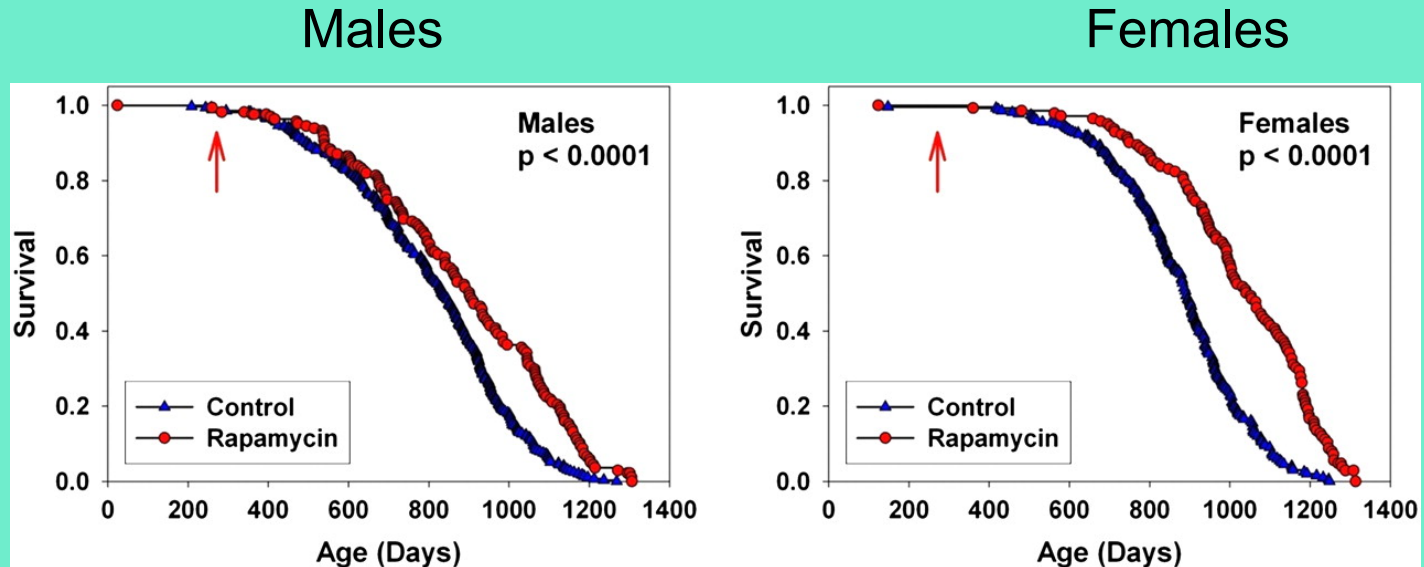

# What does Rapamycin do to Mice?

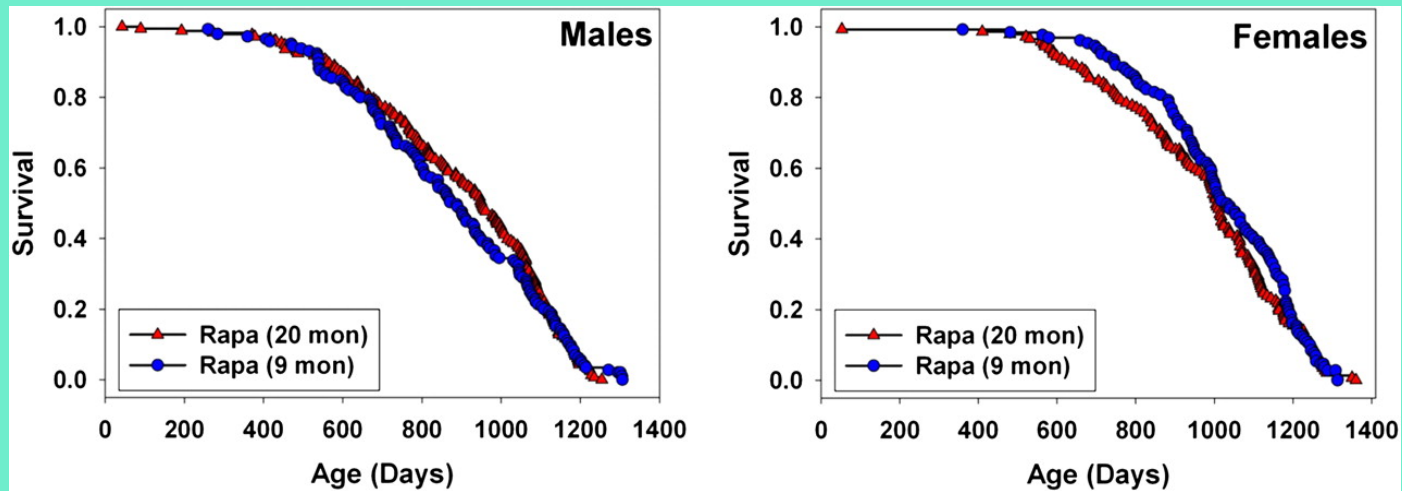

- Rapamycin treated was started at 600 days (~ 60 yo for humans)
- Increased total life expectancy 9 (male) -13 (female)%
- Increased remaining life expectancy 28 (male) – 38 (female)%
- “No change in causes of death”

# How About Treating Younger Mice?

- Rapamycin treated was started at 270 days (~ 27 yo for humans)
- Increased total life expectancy 10 (male) -18 (female)%
- Increased 90% percentile longevity 16 (male) – 13 (female)%
- “No dramatic change in the range of lethal or nonlethal illnesses ”

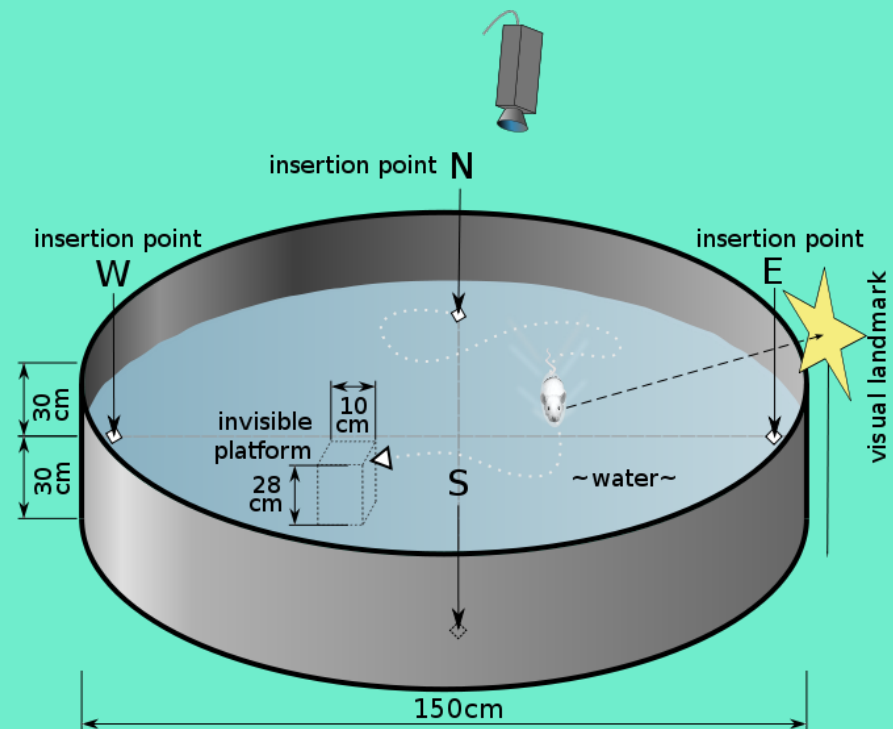

# But Don't We Expect to See More Benefit Starting Early?

- Survival curves for early vs late start are essentially the same
- ? Affects something happening later in life
- Might actually be useful in practice

# Rapamycin Improves Memory in an Alzheimer's Disease Model

How do you study memory in mice?

## Morris Water Maze

- Measures spatial memory
- Less influenced by motivation

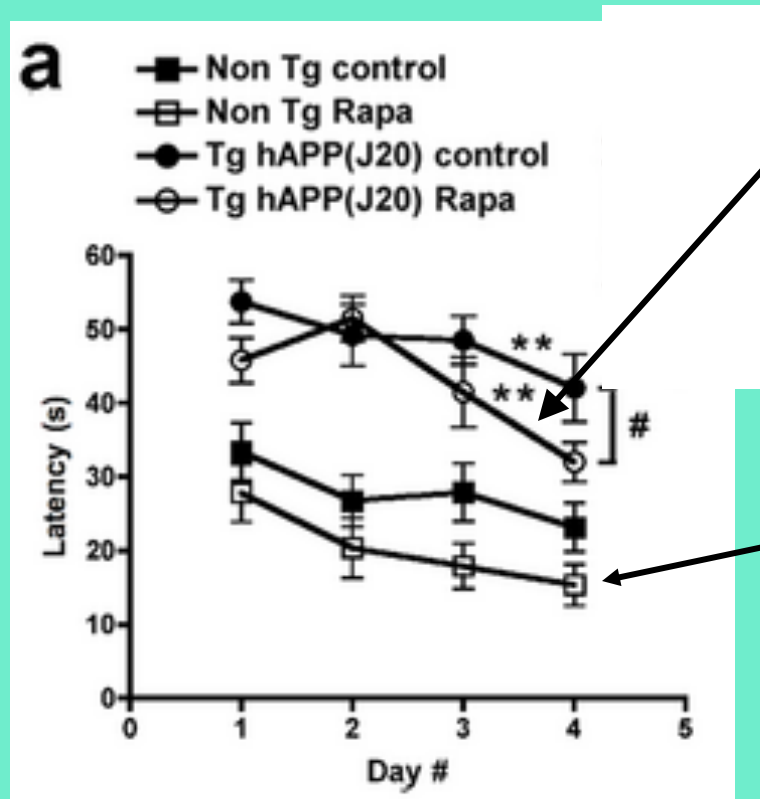

# Rapamycin Improves Memory in an Alzheimer's Disease Model

- Treated APP transgenic mice for 13 weeks starting at 4 months of age.

- Went on 6 swims/day for 4 days for training

- Measured time to find platform

- Tests learning

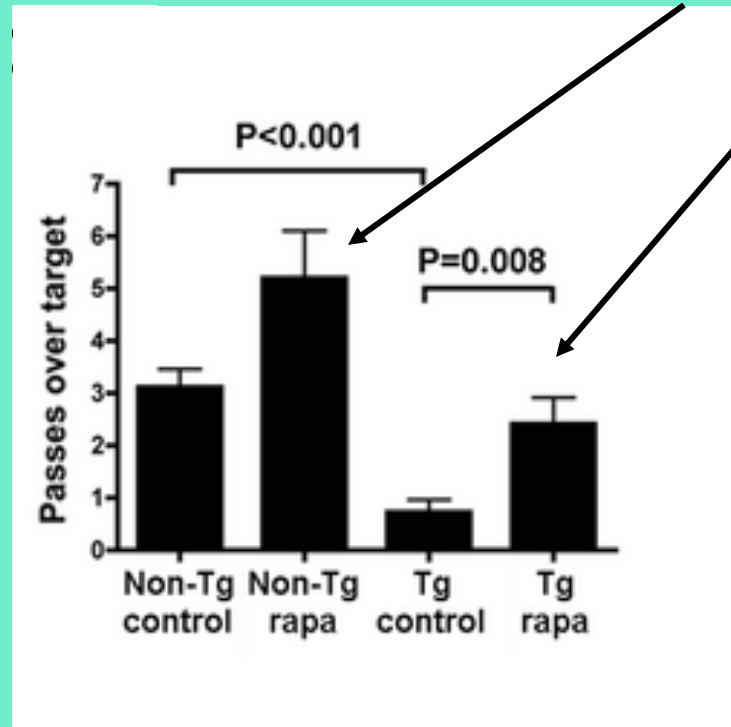

Treatment reduces time to find platform

Improves normal mice too?

Spilman, *PLOS One*, 2010

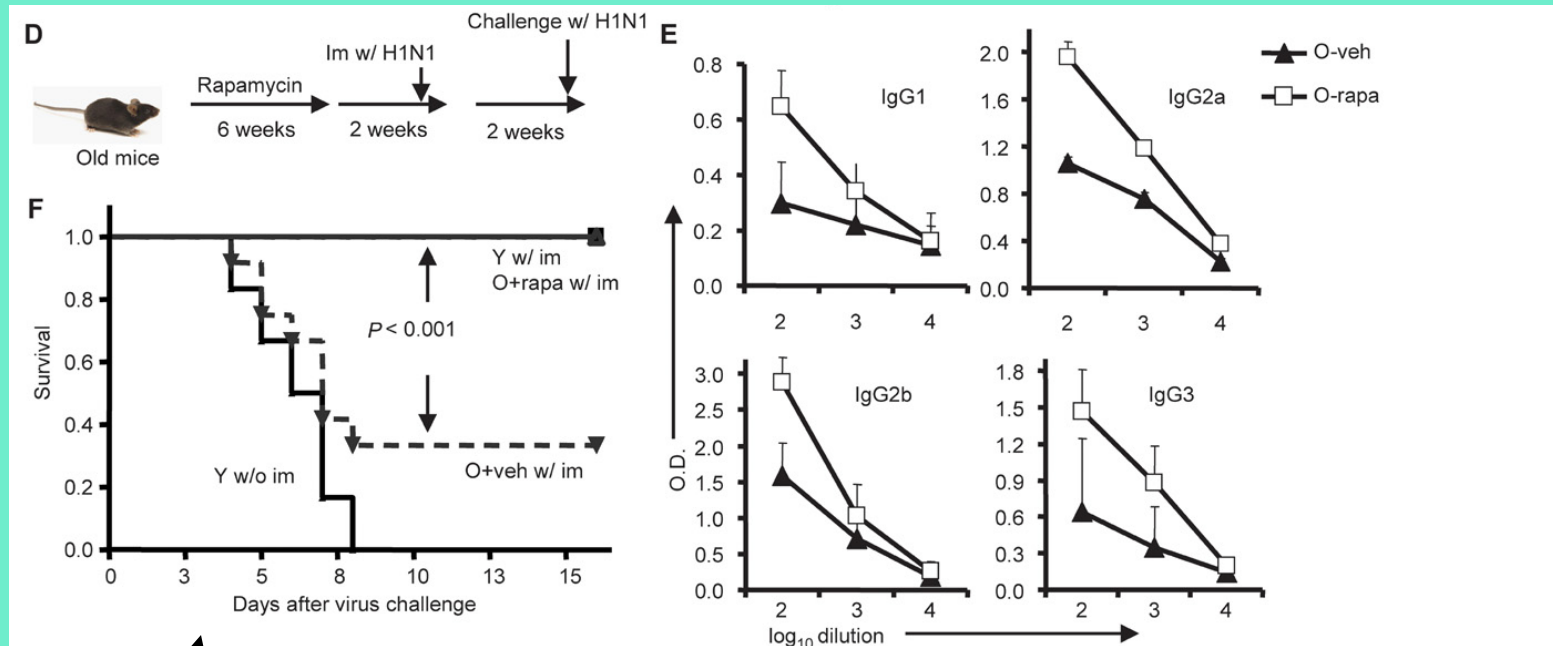

# Rapamycin Improves Memory in an Alzheimer's Disease Model

- After last trial, maze was removed and mouse put back in tank
- Looked for searching for platform in the old location
- Tests spatial memory

Improved both AD and normal mice!

# Improves Immune Function and Response to Flu Vaccination

Treatment for 6 weeks (4 mg/kg QOD):

- Produces more immature B-cells
- Gives higher titer response to flu vaccine
- Makes vaccine more effective against infection

# Summary

- Aging is a universal process that impacts on human health and function
- Biology focused research has taught us that aging is malleable and involves specific mechanisms
- Uncovering mechanisms has lead to the use of drugs to modify aging both as a research tool and as a potential therapeutic
- Benefits for people are unknown but many avenues/opportunities exist for translation to the clinic
