## Patient with RA (#2)

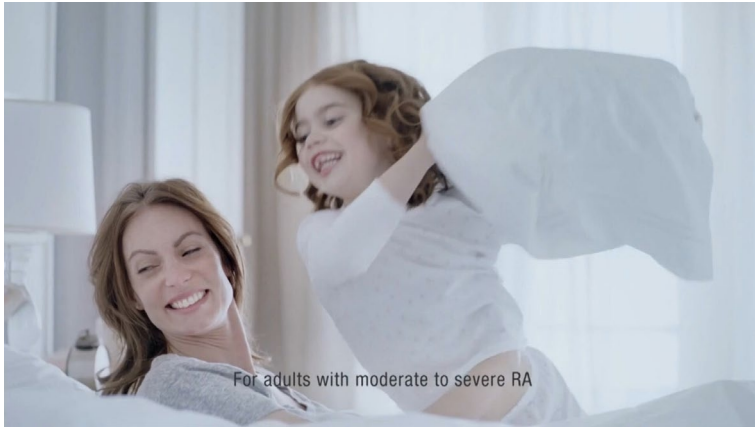

*Not from a RA commercial*

# Quiz: Match Description to Picture

- A. “TV RA”
- B. “Real RA”

**Patient with RA #1**

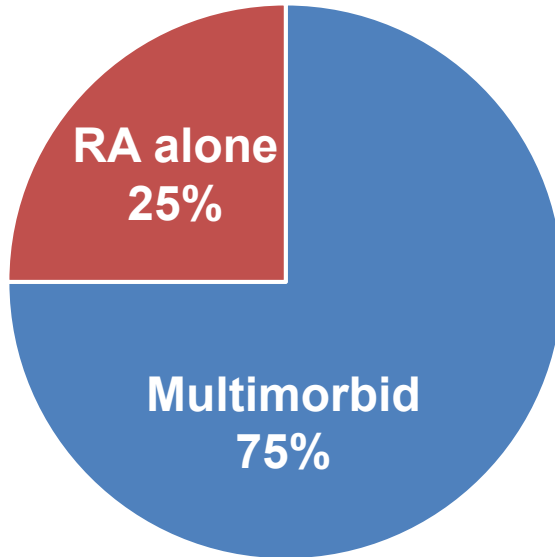

**Patient with RA #2**

# What does “Real RA” really look like?

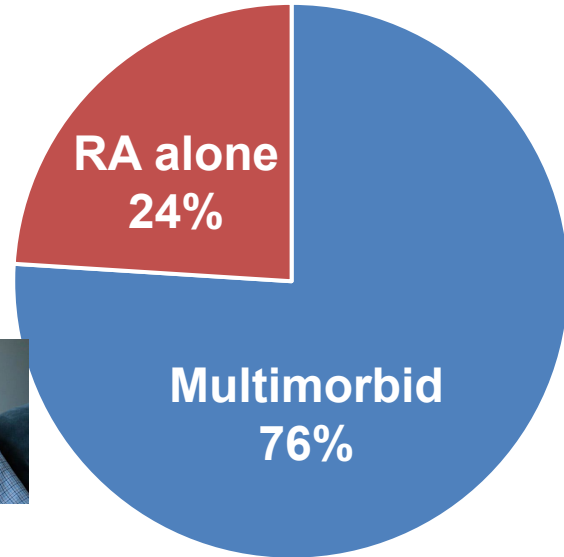

**Veterans Affairs  
Rheumatoid Arthritis  
Registry**

**FORWARD**

The National Databank for Rheumatic Diseases

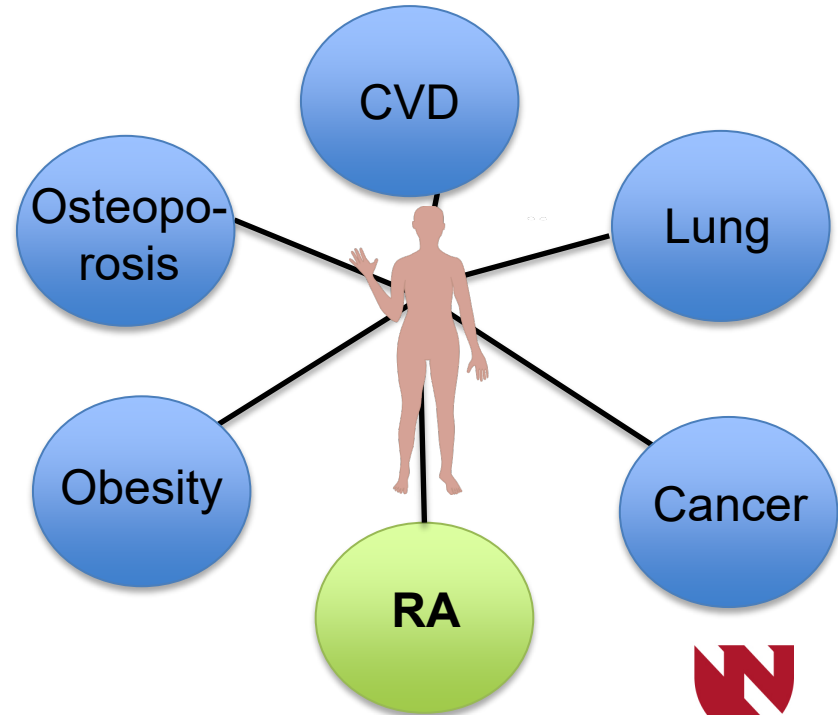

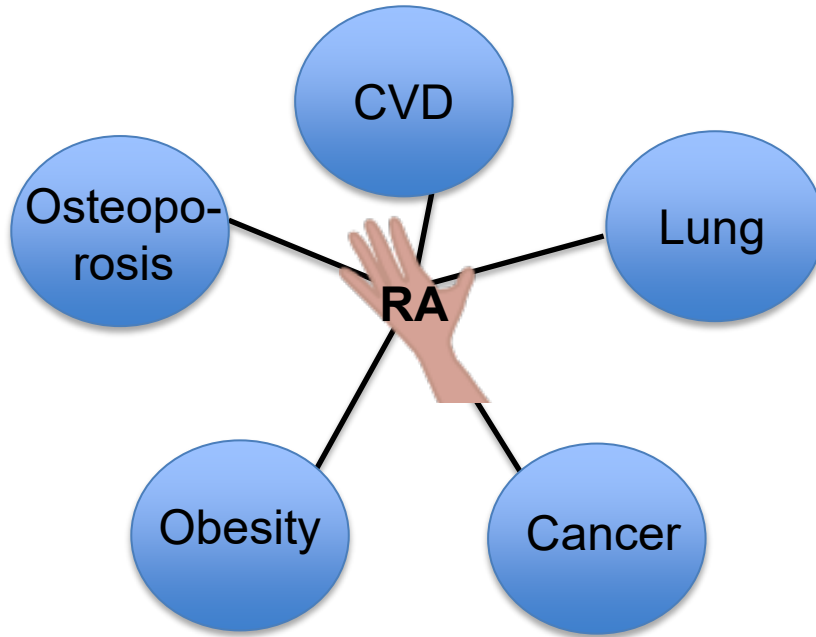

“Real” RA

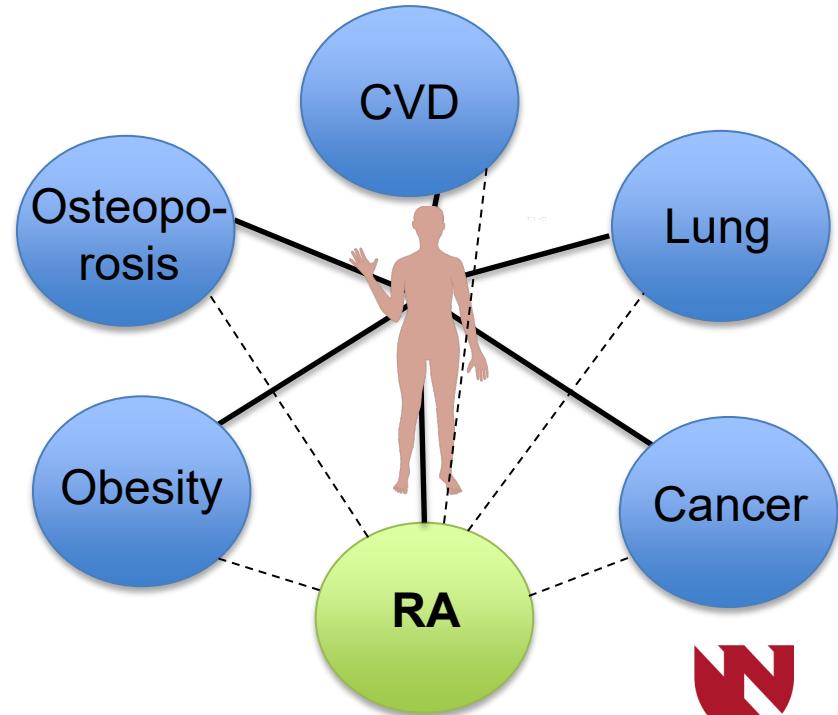

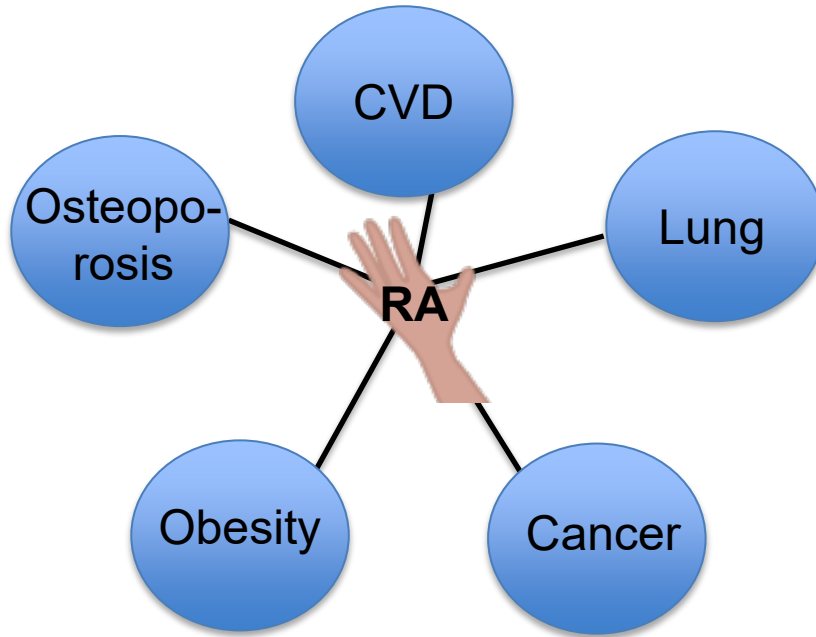

*Defined as  $\geq 1$  condition in Rheumatic Disease Comorbidity Index*

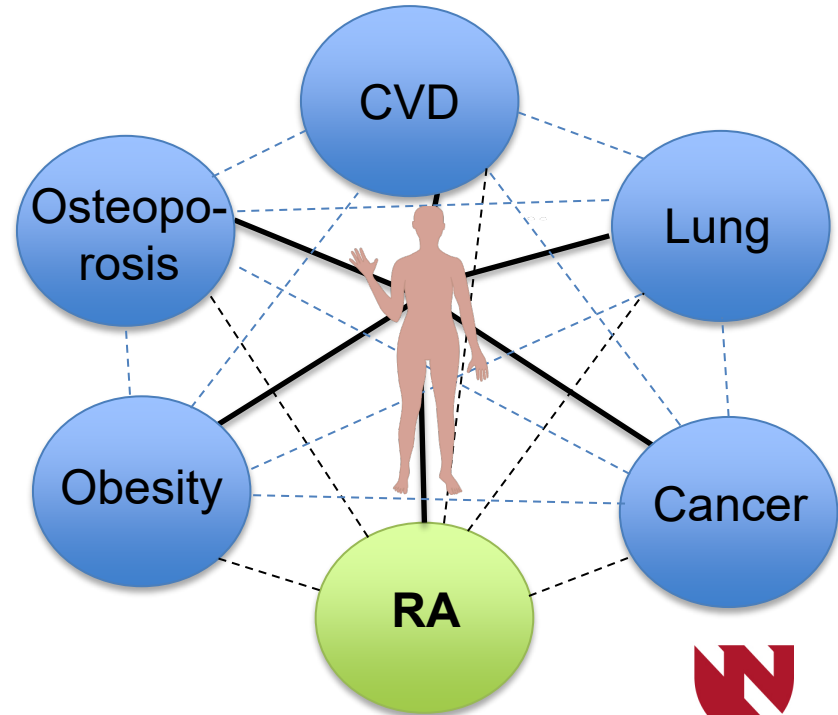

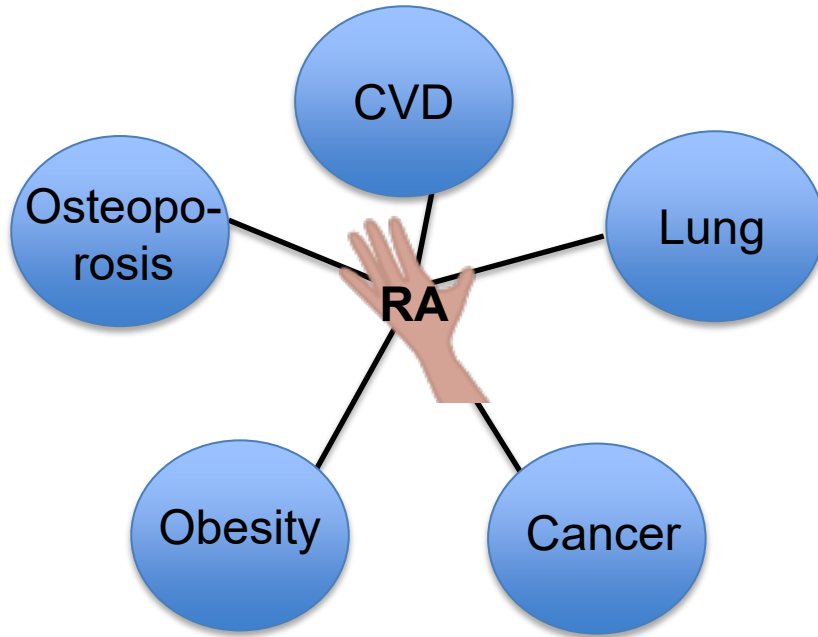

# Comorbidity vs. Multimorbidity in RA

# Comorbidity vs. Multimorbidity in RA

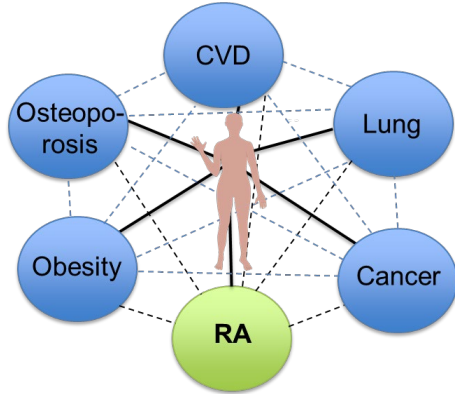

# Comorbidity vs. Multimorbidity in RA

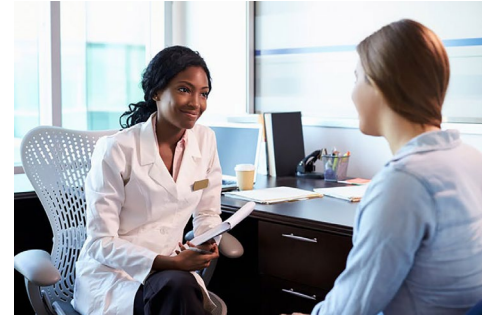

# Multimorbidity: For Specialists Too!

## 1. Drive onset & progression of multimorbidity

## 3. MM Changes disease management

## 2. Poor long-term outcomes (e.g. MM-related outcomes)

Shortened  
lifespan

Reduced  
quality of life

Increased  
healthcare use

Expensive

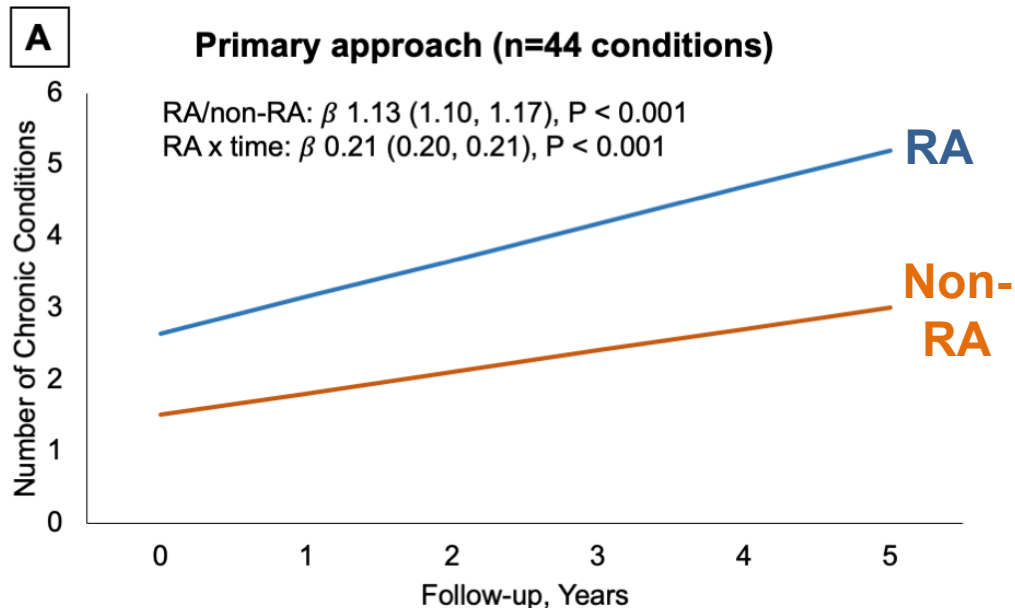

# Burden & Trajectory of Multimorbidity in RA

## MarketScan database 2006-2015

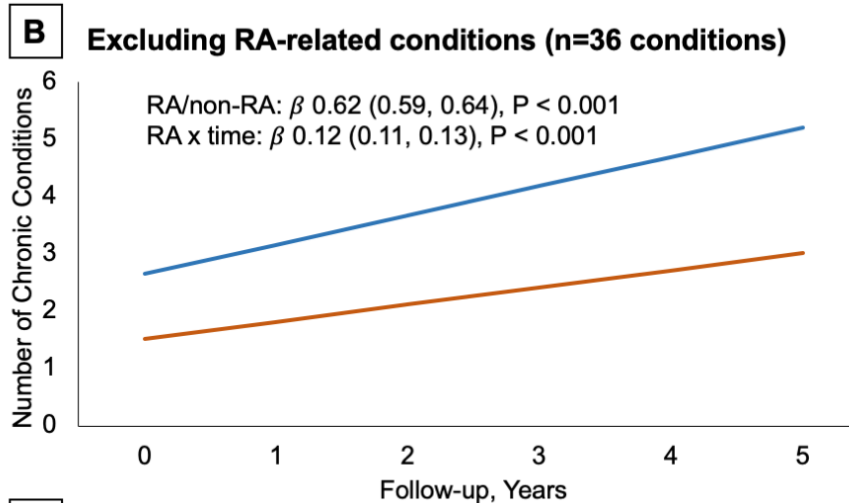

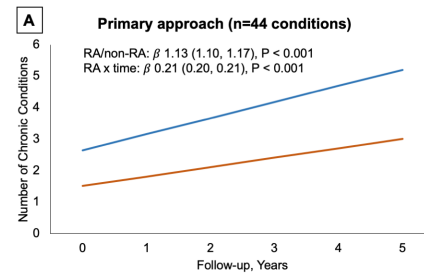

- Overall cohort (n=277k)  
Matched 1:1 RA:Non-RA
- Multimorbidity ( $\geq 2$  / 44 conditions)  
RA: 34% (**51% at 1yr**)  
Non-RA: 21%  
OR: 2.29 (2.25-2.34)

## Incident cohort (n=61k)

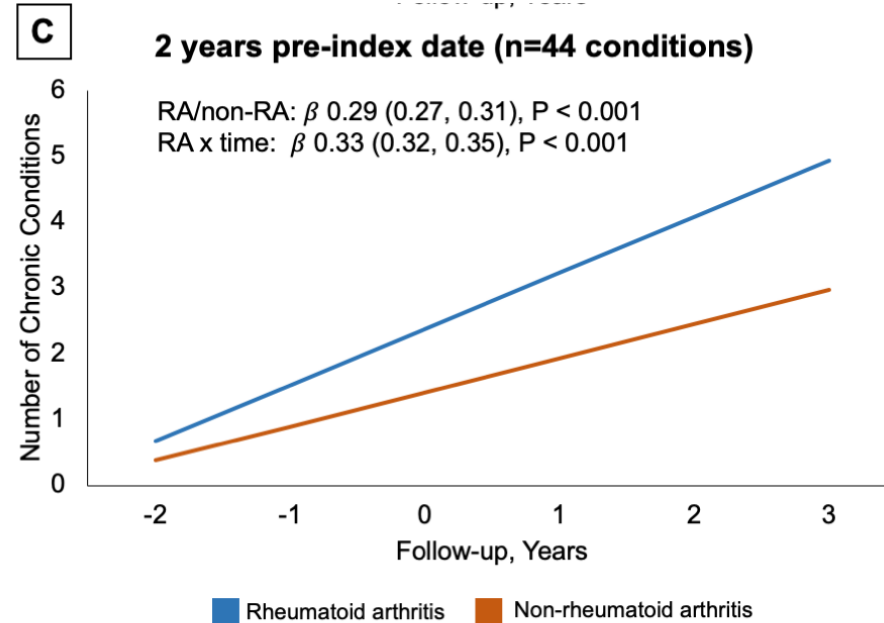

### Primary approach (n=44 conditions)

# Multimorbidity Trajectory in RA

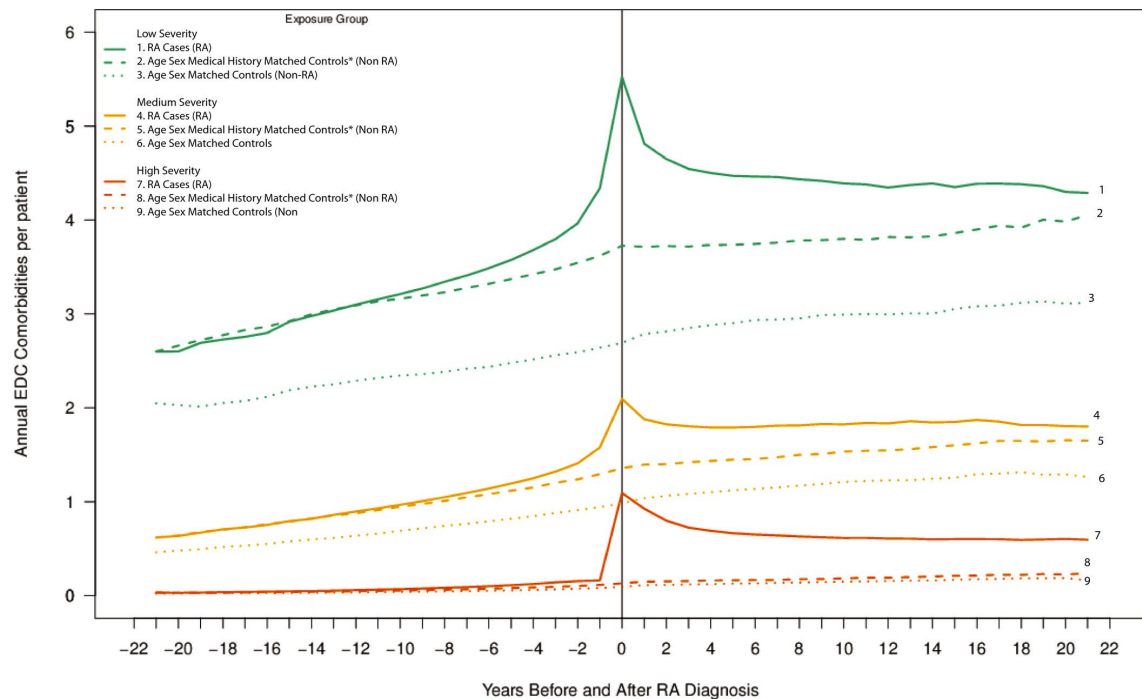

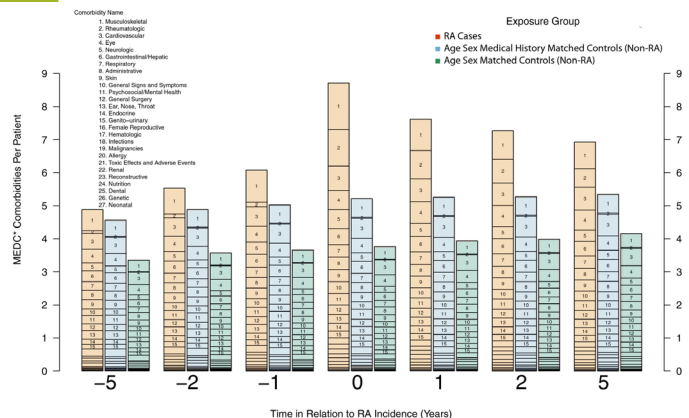

Excluded: anemia, osteoarthritis, fibromyalgia, interstitial lung disease, chronic back pain, gout, osteoporosis, inflammatory skin disorders

# Multimorbidity Trajectory in RA

- Ontario, Canada (1995-2016)
- N=27 Johns Hopkins EDC conditions
- Year of diagnosis:  
131% increase vs. control  
67% increase vs. medical history matched

# of Patients Alive (thousands)

# Outcomes from Multimorbidity in RA

- Multimorbidity accounted some of the excess all-cause and cardiovascular mortality in RA
  - Nurses Health Study (1k RA, 10k matched non-RA)
  - Multimorbidity weighted index (n=61 conditions)
  - HR 1.5 -> 1.2 with adjustment for multimorbidity burden
- Multimorbidity associated with poor HRQOL
  - Derived in BRASS, validated in COMORA cohort
  - Multimorbidity index (MMI; n=40 conditions)
  - Weighted and unweighted MMI outperformed Charlson for predicting EQ-5D

# 2021 ACR RA Treatment Guidelines

**Table 6.** Specific patient populations\*

Recommendations	Certainty of evidence	Based on the evidence report(s) of the following PICO(s)	Evidence table(s), in Supp. App. 2
<b>Subcutaneous nodules</b> Methotrexate is <b>conditionally</b> recommended over alternative DMARDs for patients with subcutaneous nodules who have moderate-to-high disease activity. Switching to a non-methotrexate DMARD is <b>conditionally</b> recommended over continuation of methotrexate for patients taking methotrexate with progressive subcutaneous nodules.	Very low	PICO 64	p. 427
	Very low	PICO 65	p. 428
<b>Pulmonary disease</b> Methotrexate is <b>conditionally</b> recommended over alternative DMARDs for the treatment of inflammatory arthritis for patients with clinically diagnosed mild and stable airway or parenchymal lung disease who have moderate-to-high disease activity.	Very low	PICO 67	p. 430
<b>Heart failure</b> Addition of a non-TNF inhibitor bDMARD or tsDMARD is <b>conditionally</b> recommended over addition of a TNF inhibitor for patients with NYHA class III or IV heart failure and an inadequate response to csDMARDs. Switching to a non-TNF inhibitor bDMARD or tsDMARD is <b>conditionally</b> recommended over continuation of a TNF inhibitor for patients taking a TNF inhibitor who develop heart failure.	Very low	PICO 70	p. 435
	Very low	PICO 71	p. 436
<b>Lymphoproliferative disorder</b> Rituximab is <b>conditionally</b> recommended over other DMARDs for patients who have a previous lymphoproliferative disorder for which rituximab is an approved treatment and who have moderate-to-high disease activity.	Very low	PICO 75 and PICO 76	p. 446–7
<b>Hepatitis B infection</b> Prophylactic antiviral therapy is <b>strongly</b> recommended over frequent monitoring alone for patients initiating rituximab who are hepatitis B core antibody positive (regardless of hepatitis B surface antigen status). Prophylactic antiviral therapy is <b>strongly</b> recommended over frequent monitoring alone for patients initiating any bDMARD or tsDMARD who are hepatitis B core antibody positive and hepatitis B surface antigen positive. Frequent monitoring alone is <b>conditionally</b> recommended over prophylactic antiviral therapy for patients initiating a bDMARD other than rituximab or a tsDMARD who are hepatitis B core antibody positive and hepatitis B surface antigen negative.	Very low	PICO 82	p. 459
	Very low	PICO 83	p. 464
	Very low	PICO 84	p. 471
<b>Nonalcoholic fatty liver disease</b> Methotrexate is <b>conditionally</b> recommended over alternative DMARDs for DMARD-naïve patients with nonalcoholic fatty liver disease, normal liver enzymes and liver function tests, and no evidence of advanced liver fibrosis who have moderate-to-high disease activity.	Very low	PICO 87	p. 489
<b>Persistent hypogammaglobulinemia without infection</b> In the setting of persistent hypogammaglobulinemia without infection, continuation of rituximab therapy for patients at target is <b>conditionally</b> recommended over switching to a different bDMARD or tsDMARD.	Very low	PICO 66	p. 429
<b>Previous serious infection</b> Addition of csDMARDs is <b>conditionally</b> recommended over addition of a bDMARD or tsDMARD for patients with a serious infection within the previous 12 months who have moderate-to-high disease activity despite csDMARD monotherapy. Addition of/switching to DMARDs is <b>conditionally</b> recommended over initiation/dose escalation of glucocorticoids for patients with a serious infection within the previous 12 months who have moderate-to-high disease activity.	Very low	PICO 88	p. 490
	Very low	PICO 90 and PICO 91	p. 496–7
<b>Non-tuberculous mycobacterial lung disease</b> Use of the lowest possible dose of glucocorticoids (discontinuation if possible) is <b>conditionally</b> recommended over continuation of glucocorticoids for patients with non-tuberculous mycobacterial lung disease. Addition of csDMARDs is <b>conditionally</b> recommended over addition of a bDMARD or tsDMARD for patients with non-tuberculous mycobacterial lung disease who have moderate-to-high disease activity despite csDMARD monotherapy.	Very low	No relevant PICO	
	Very low	PICO 92	p. 498
Abatacept is <b>conditionally</b> recommended over other bDMARDs and tsDMARDs for patients with non-tuberculous mycobacterial lung disease who have moderate-to-high disease activity despite csDMARDs.	Very low	PICO 93	p. 499

Recommendations	Certainty of evidence	Based on the evidence report(s) of the following PICO(s)	Evidence table(s), in Supp. App. 2
<b>Subcutaneous nodules</b> Methotrexate is <b>conditionally</b> recommended over alternative DMARDs for patients with subcutaneous nodules who have moderate-to-high disease activity. Switching to a non-methotrexate DMARD is <b>conditionally</b> recommended over continuation of methotrexate for patients taking methotrexate with progressive subcutaneous nodules.	Very low	PICO 64	p. 427
	Very low	PICO 65	p. 428
<b>Pulmonary disease</b> Methotrexate is <b>conditionally</b> recommended over alternative DMARDs for the treatment of inflammatory arthritis for patients with clinically diagnosed mild and stable airway or parenchymal lung disease who have moderate-to-high disease activity.	Very low	PICO 67	p. 430
<b>Heart failure</b> Addition of a non-TNF inhibitor bDMARD or tsDMARD is <b>conditionally</b> recommended over addition of a TNF inhibitor for patients with NYHA class III or IV heart failure and an inadequate response to csDMARDs. Switching to a non-TNF inhibitor bDMARD or tsDMARD is <b>conditionally</b> recommended over continuation of a TNF inhibitor for patients taking a TNF inhibitor who develop heart failure.	Very low	PICO 70	p. 435
	Very low	PICO 71	p. 436
<b>Lymphoproliferative disorder</b> Rituximab is <b>conditionally</b> recommended over other DMARDs for patients who have a previous lymphoproliferative disorder for which rituximab is an approved treatment and who have moderate-to-high disease activity.	Very low	PICO 75 and PICO 76	p. 446–7
<b>Hepatitis B infection</b> Prophylactic antiviral therapy is <b>strongly</b> recommended over frequent monitoring alone for patients initiating rituximab who are hepatitis B core antibody positive (regardless of hepatitis B surface antigen status). Prophylactic antiviral therapy is <b>strongly</b> recommended over frequent monitoring alone for patients initiating any bDMARD or tsDMARD who are hepatitis B core antibody positive and hepatitis B surface antigen positive. Frequent monitoring alone is <b>conditionally</b> recommended over prophylactic antiviral therapy for patients initiating a bDMARD other than rituximab or a tsDMARD who are hepatitis B core antibody positive and hepatitis B surface antigen negative.	Very low	PICO 82	p. 459
	Very low	PICO 83	p. 464
	Very low	PICO 84	p. 471
<b>Nonalcoholic fatty liver disease</b> Methotrexate is <b>conditionally</b> recommended over alternative DMARDs for DMARD-naïve patients with nonalcoholic fatty liver disease, normal liver enzymes and liver function tests, and no evidence of advanced liver fibrosis who have moderate-to-high disease activity.	Very low	PICO 87	p. 489
<b>Persistent hypogammaglobulinemia without infection</b> In the setting of persistent hypogammaglobulinemia without infection, continuation of rituximab therapy for patients at target is <b>conditionally</b> recommended over switching to a different bDMARD or tsDMARD.	Very low	PICO 66	p. 429
<b>Previous serious infection</b> Addition of csDMARDs is <b>conditionally</b> recommended over addition of a bDMARD or tsDMARD for patients with a serious infection within the previous 12 months who have moderate-to-high disease activity despite csDMARD monotherapy. Addition of/switching to DMARDs is <b>conditionally</b> recommended over initiation/dose escalation of glucocorticoids for patients with a serious infection within the previous 12 months who have moderate-to-high disease activity.	Very low	PICO 88	p. 490
	Very low	PICO 90 and PICO 91	p. 496–7
<b>Non-tuberculous mycobacterial lung disease</b> Use of the lowest possible dose of glucocorticoids (discontinuation if possible) is <b>conditionally</b> recommended over continuation of glucocorticoids for patients with non-tuberculous mycobacterial lung disease. Addition of csDMARDs is <b>conditionally</b> recommended over addition of a bDMARD or tsDMARD for patients with non-tuberculous mycobacterial lung disease who have moderate-to-high disease activity despite csDMARD monotherapy.	Very low	No relevant PICO	
	Very low	PICO 92	p. 498
Abatacept is <b>conditionally</b> recommended over other bDMARDs and tsDMARDs for patients with non-tuberculous mycobacterial lung disease who have moderate-to-high disease activity despite csDMARDs.	Very low	PICO 93	p. 499

Only considered  
9 chronic  
conditions

What if a patient  
has multiple  
chronic  
conditions?

Certainty of  
evidence: Very Low

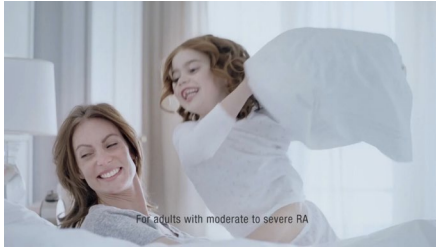

Fraenkel L et al. Arth Rheum, 2021.

*Or Paradox?*

# The Process of Evidence Based Medicine

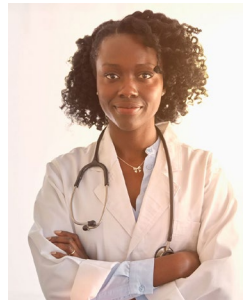

“TV” RA

DBRCT

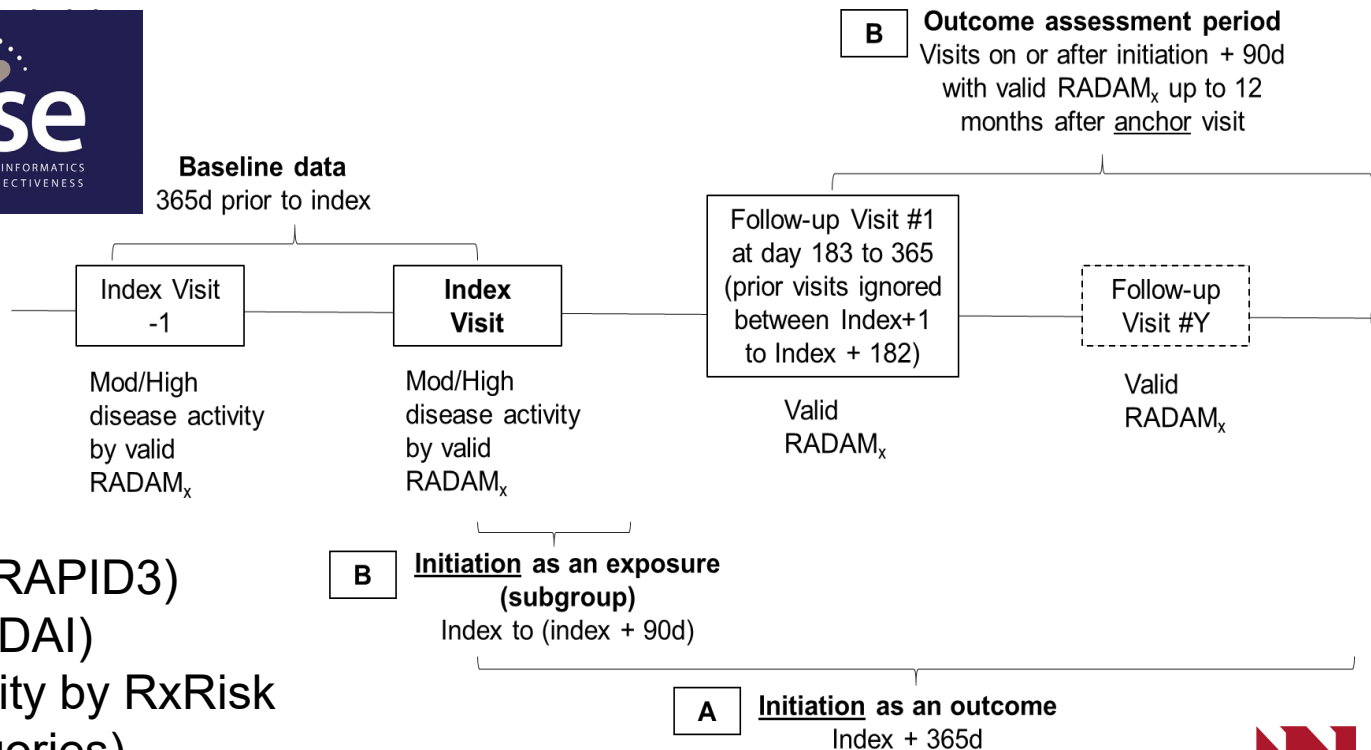

“Real” RA

**Guidelines**

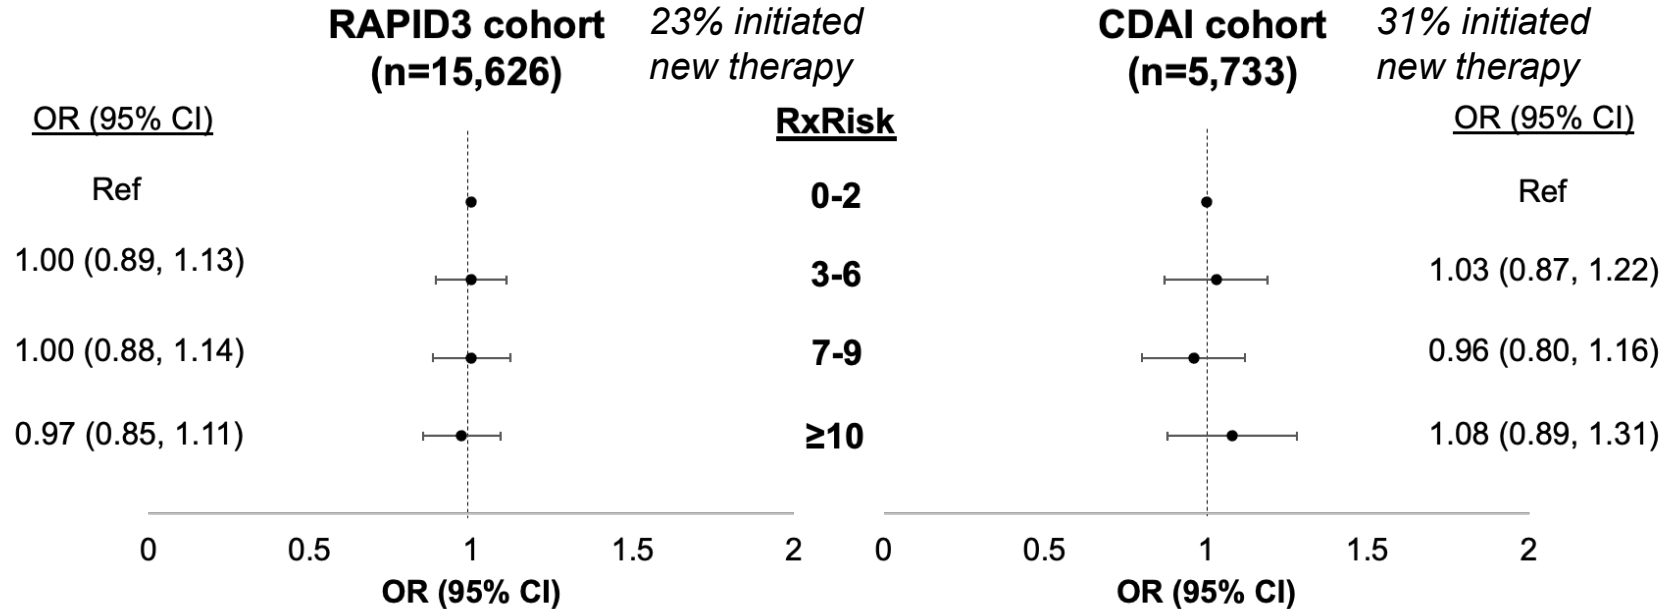

# Multimorbidity & RA Treatment: Real-World Data

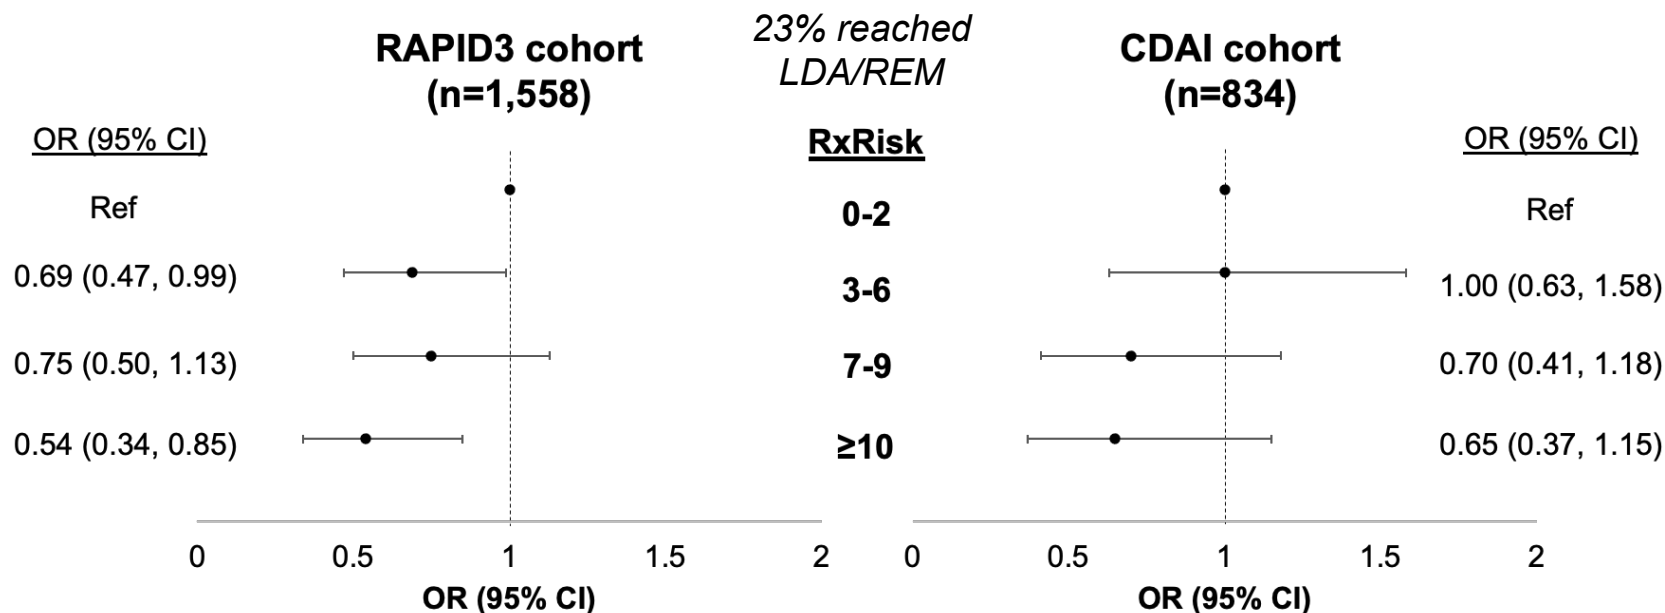

- N=15,626 (RAPID3)
- N=5,733 (CDAI)
- Multimorbidity by RxRisk (n=46 categories)
- Mean RxRisk 6-7

# Multimorbidity & Initiating RA Treatment

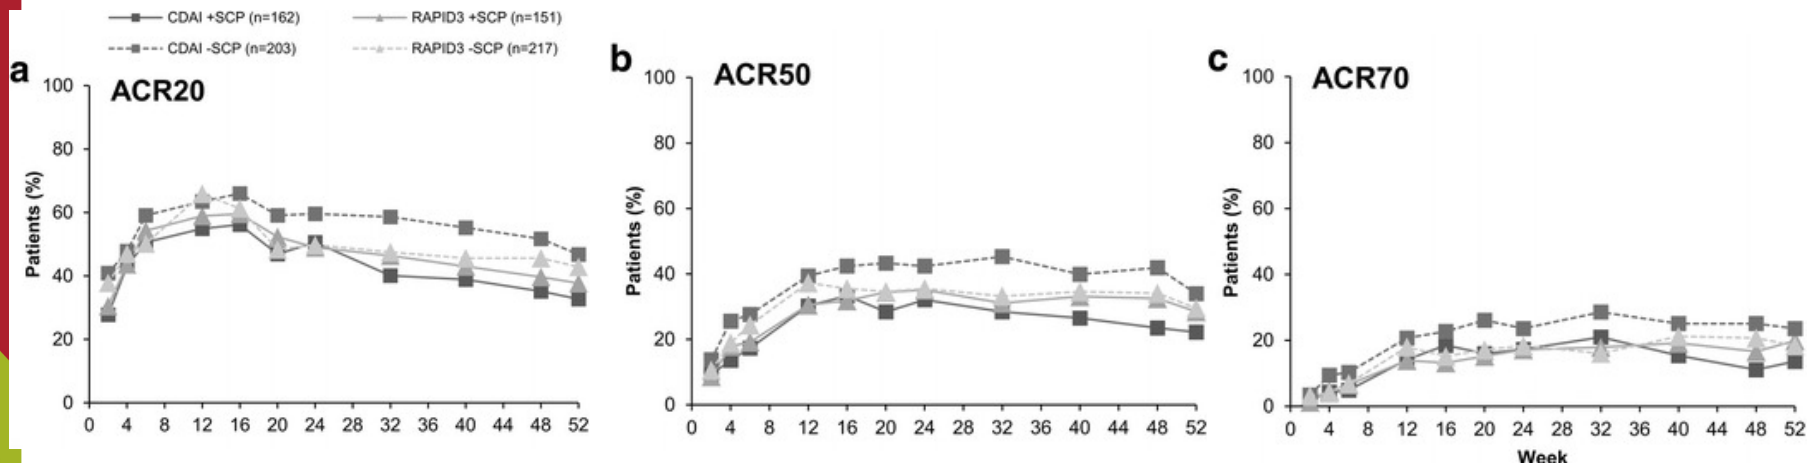

# Multimorbidity & Achieving RA Target

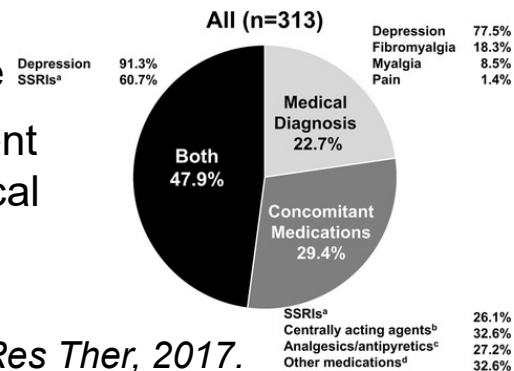

Adjusted for age, sex, race, U.S. region, insurance status, seropositivity, number of visits, oral steroids, number of prior csDMARDs, number of prior bDMARDs, number of prior tsDMARDs, baseline disease activity category, treatment being initiated (cDMARD, TNFi, non-TNFi bDMARD, tsDMARD)

# Somatization Comorbidity Phenotype & Treatment Response

- RCT of RAPID3 vs. CDAI assessment of certolizumab response
- **SCP** = use of concomitant medications indicated for the treatment of depression, anxiety, or neuropathic pain –OR– baseline medical diagnosis of depression, chronic pain, fibromyalgia, or myalgias

Curtis JR et al. Arth Res Ther, 2017.

# Multimorbidity & Shared Decision Making

**Patient Global Assessment of Disease Activity**

Ask the patient: Considering all the ways your arthritis affects you, rate how well you are doing on the following scale?

Very Well	0	0.5	1.0	1.5	2.0	2.5	3.0	3.5	4.0	4.5	5.0	5.5	6.0	6.5	7.0	7.5	8.0	8.5	9.0	9.5	10	Poor
-----------	---	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	----	------

- Treat-to-target, still the best option?
  - Are measures valid in multimorbid individuals?
  - Lower effectiveness of medications?
  - Higher risk of medications?
  - Will I meet quality metrics for reimbursement?
- Other health conditions may be the priority
- Are their arthritis symptoms limiting their function/QOL?
- Polypharmacy
- Expensive medications/healthcare

# Example 1: RA and CVD prevention

**58 y/o female with RA has lipid panel drawn:**

- LDL 92 mg/dL
- ASCVD risk 4%
- Low risk, no statin initiated

**High RA disease activity at last rheumatology visit:**

- RA associated with 1.5-fold increased risk of CVD (risk calculators underestimate risk)
- Lipid paradox (LDL low during active inflammation)
- Taking prednisone 7.5 mg daily

**Who runs the CVD prevention show?**

PCP – understands CVD prevention, but ? RA impact

Rheum – understands RA impact, but? CVD prevention

Cardiology?

Both?

## Example 2: RA and ILD

**67 y/o male with RA reports mild, non-productive cough:**

- CT shows reticulation in subpleural region, bilateral lung bases
- PFT reveals normal FVC, DLCO
- Disease activity moderate
- Regimen: methotrexate, etanercept

### **Who runs the show?**

Rheum – change etanercept to rituximab, see pulm

Pulm – stop methotrexate and enbrel, start nintedanib, see rheum

# Multimorbid RA

“Real RA”

- “Real RA” patients are multimorbid
- RA drives multimorbidity onset and progression early in the disease course
- Multimorbidity causes bad things to happen and changes the RA treatment landscape
- Understanding the patterns/networks of RA multimorbidity may allow for targeted intervention
- Research needs: A LOT – identification, assessment, pathophysiology, management, patient preferences, care delivery models
